HOWARD SCHUMAN is professor and research scientist emeritus at the Institute of Social Research, University of Michigan, and coauthor of Questions and Answers in Attitude Surveys (1981) and Racial Attitudes in America (1997).

DAVID O. SEARS is professor of psychology and political science and director of the Institute for Social Science Research at UCLA. He is coauthor of The Politics of Violence: The New Urban Blacks and the Watts Riot (1973) and Tax Revolt: Something for Nothing in California (1985).

JIM SIDANIUS is professor of psychology at UCLA and coauthor of Social Dominance: An Intergroup Theory of Social Hierarchy and Oppression (1990).

PAM SINGH is a doctoral candidate in political science at UCLA.

PAUL M. SNIDERMAN is professor of political science at Stanford University. He is coauthor of Reasoning and Choice: Explorations in Political Psychology (1995) and Reaching beyond Race (1997).

MARYLEE C. TAYLOR is associate professor of sociology at Pennsylvania State University.

STEVEN A. TUCK is professor of sociology at George Washington University and coeditor of Racial Attitudes in the 1990s (1997).

ONE Race in American Politics
Framing the Debates

DAVID O. SEARS
JOHN J. HETTS
JIM SIDANIUS
LAWRENCE BOBO

The place of African Americans in American society has been a controversial question on the political agenda throughout American history. The system of chattel slavery established at the very outset generated intense debates for over two hundred years, even in the framing of the major founding documents of the nation, and ultimately triggered a bloody Civil War. Even after formal emancipation, the Southern “Jim Crow” system of official discrimination and segregation and parallel, though somewhat milder, practices in the North kept blacks in an officially designated lower-caste status.

That began to erode after World War II, perhaps most symbolically in 1954 in the unanimous Supreme Court ruling that racially separate school systems were unconstitutional because they were inherently unequal. Steadily growing institutional strength and political organization in Southern black communities soon led to increasingly numerous civil rights protests. Federal government policy finally shifted dramatically when the 1964 Civil Rights Act provided guarantees of equal opportunity and the 1965 Voting Rights Act secured full black enfranchisement.

Ironically, Northern urban ghettos almost immediately began to erupt in “long hot summers” of violence. Racial problems came to be viewed by the general public as among the nation’s “most important problems,” and many observers felt that America was in a state of racial crisis. A presidential commission concluded with great optimism that “our nation is moving toward two societies, one black, one white—
separate and unequal" (Report of the National Advisory Commission on Civil Disorders 1968, 1). And racial issues have been on the political agenda ever since. Beginning in the 1970s, court-ordered busing produced extensive protest and eventually massive levels of "white flight." Racially tinged issues, such as welfare, crime, "permissive judges," and government regulation, have been the subject of strenuous political debate and draconian legislation for three decades. Now referenda aimed at abolishing affirmative action in government are increasingly appearing on state ballots.

It would be surprising if the effects of 350 years of formalized racial inequality could be quickly eliminated. Much progress has been made, of course. But significant racial gaps in most domains of the quality of life continue to exist, and the races are highly polarized about what to do about them. The role of government is perhaps the most centrally contested issue. The authors represented in this volume have major differences of opinion, as will be seen, but they all share the belief that the opinions of the electorate will in the end be decisive.

This book, then, focuses on the nature of public opinion about race in the United States and on its effects on politics. However, public opinion does not exist in a vacuum. It is about something. In our case, that something concerns the reality of blacks' lives in America and what government should be doing about it. This chapter begins, therefore, with a brief appraisal of blacks' situation in America. Though much progress has been made in the last half century, blacks continue to be substantially disadvantaged relative to whites, and that racial gap to be substantially disadvantageous relative to whites, and that racial gap to be substantially disadvantageous relative to whites, and that the proportion of black men in white-collar occupations increased from 5 percent in 1940 to 22 percent in 1970 and then again to 32 percent in 1990. But the proportion of whites in such occupations has also substantially increased, so blacks remain severely underrepresented in almost all higher-status occupations.

Blacks' income increased greatly in the years after World War II, both in absolute terms and relative to whites. For example, the black/white ratio in median annual earnings for men increased from 43 in 1940 to 73 in 1980. Since then, blacks' income has continued to increase in absolute terms, but the black/white ratio has not improved further. Moreover, blacks have considerably less economic reserve than do whites. Black households earned about 60 percent as much as the average white household in 1988, but had only 5 percent as much net worth.

Blacks' educational level also showed impressive improvement after World War II. In 1940, 49 percent of the black population had less than five years of schooling, as opposed to only 15 percent of whites. By 1990, blacks were over 90 percent as likely as whites to be high school graduates. But a high school education is no longer as valuable as it once was. Blacks' rate of college enrollment also in-

The Current State of Black America

In 1965, many were hopeful that the guarantee of formal equal rights would result in the end of most racial inequalities. Since then, there has indeed been much improvement. Nevertheless, blacks today remain at a substantial disadvantage by most standard indicators. This gap between the races has in many respects not narrowed appreciably for the past two decades.

Perhaps the ultimate bottom line is life expectancy. Though blacks' longevity has improved substantially in the past half century, the racial gap has scarcely changed at all. To understand such a difference, it is natural to turn first to basic socioeconomic indicators. Blacks have always been substantially more likely to be unemployed than whites. That difference has not varied greatly since the mid-1970s, with the black unemployment rate holding at about double that for whites in good times or bad. To be sure, among the employed, blacks have moved up the occupational ladder substantially. For example, the proportion of black men in white-collar occupations increased from 5 percent in 1940 to 22 percent in 1970 and then again to 32 percent in 1990. But the proportion of whites in such occupations has also substantially increased, so blacks remain severely underrepresented in almost all higher-status occupations.
creased sharply through the 1970s, and the racial gap in initial college enrollment had virtually been eliminated by 1980. But since then, the racial gap in college enrollment has increased substantially, and blacks’ rate of college graduation is falling off (see Farley 1996, 231). Blacks and whites remain surprisingly isolated from one another.

Douglas Massey and Nancy Denton (1993, 2) concluded that, as of 1980, “no group in the history of the United States has ever experienced the sustained high level of residential segregation that has been imposed on blacks in large American cities for the past fifty years.” At that time, Reynolds Farley and his colleagues (1978) proposed the image of “chocolate city–vanilla suburbs” to describe the phenomenon of black-dominated central cities surrounded by nearly all-white suburban rings. Since then, blacks have increasingly moved into the suburbs. Often that simply reflects the spillover of black residential areas beyond city limits, however, and blacks remain the most residentially segregated minority group. Similarly, blacks are by far the least likely of all minority groups in America to engage in racial or ethnic intermarriage; as of 1980, only about 6 percent of all marriages by young African Americans were interracial (see Farley 1996, 234). Blacks have become an increasingly important political force in their own right. Black registration and turnout surged following passage of the Voting Rights Act in 1965 and today are comparable to those of whites in the nation as a whole. Black voters are among the most loyal supporters of the Democratic Party at the same time that they generally demonstrate a strong sense of racial solidarity in politics. One result is that the number of black elected officials has increased enormously since the civil rights era, most elected in majority black constituencies. Nevertheless, the racial gap persists in this realm as well. The best rule of thumb is that prominent black candidates. The size of the black middle class has increased substantially. The percentage of blacks earning at least twice the poverty-line level of income rose from 1 percent in 1940 to almost 50 percent by the mid-1970s. But in this respect, too, progress has slowed markedly; that trend continues. As Melvin Oliver and Thomas Shapiro (1993, 53) put it, “An accurate and realistic appraisal of the economic footing of the black middle class reveals its precari-

ousness, marginality, and fragility.”

At the other end of the spectrum, the proportion of blacks living in poverty declined sharply until the 1970s, but has remained about constant since then. This is reflected in the concentration of poverty in racially segregated neighborhoods, high levels of male joblessness in central cities, high rates of black involvement in violent crime as both victims and perpetrators, and high rates of female-headed families and out-of-wedlock births (Bobo 1987a; Wilson 1992). For example, at any given time, about one-third of all young black men are entrapped in the criminal justice system—whether incarcerated, on parole, or on probation. And far more black than white children are born out of wedlock, and far more are living in female-headed households. In these areas, there has been little improvement, either in absolute terms or relative to whites.

At a broad level, then, blacks now have greater opportunity and are much better off than they were before World War II. Still, a substantial racial gap remains in many areas. That much seems to be largely agreed upon. But the trend in those gaps remains a matter of controversy. Some, such as Stephan and Abigail Thernstrom (1987), see a continuing convergence between the races, even if slower in the last two decades, so that the gaps are likely to disappear with time. Others perceive progress as having essentially come to a halt two decades ago. For example, Farley concludes that “black-white discrepancies in the most important indicators of economic status have been persistent for at least two decades” (1996, 253–58). And there are prominent long-term pessimists. Andrew Hacker concludes that the United States confronts “a huge racial chasm . . . and there are few signs that the coming century will see it closed” (1992, 219). Derrick Bell argues that “racism is an integral, permanent, and indestructible component of this society. Indeed, the racism that made slavery feasible is far from dead in the last decade of twentieth century America; and the civil rights gains, so hard won, are being steadily eroded” (1992, n. 3).

A second matter of dispute concerns the causes of these racial gaps. Some critique black culture. Blacks show a lack of work ethic; they self-segregate rather than taking a chance on living in integrated neighborhoods; they engage in violent crime rather than obeying the law; and they are irresponsible about their families, sexuality, alcohol, and drug use, leading to the continued deterioration of the black nuclear
family (e.g., D’Souza 1995; Sowell 1994; Roth 1994, Thernstrom and Thernstrom 1997). Others point to white racism and a wide range of discriminatory practices, such as arbitrary traffic stops by white police, restrictive home mortgage lending policies, differential imposition of the death penalty, and white taxpayers’ refusal to provide resources to overcome racial disadvantage. Considerable systematic research has been done on racial discrimination in domains such as employment, housing, education, financial services, health care, the retail market, and the criminal justice system. Recent reviews conclude that it continues to be real and pervasive. Even middle-class blacks prove to be exposed to relentless and ubiquitous personal experiences of discrimination (Feagin and Sikes 1994; also see Hochschild 1995).

**FEDERAL RACIAL POLICY**

The fate of African Americans, and of race relations in America, will depend on many factors. At this juncture, however, Americans find themselves in a period of great controversy and collective uncertainty about racial problems. Some of the greatest controversies now concern the proper role of government in dealing with those problems.

Between the end of Reconstruction and the end of World War II, the federal government rarely addressed the problem of race, and the two political parties differed little on such questions. In the South, blacks had been effectively disfranchised, and the Republican Party had virtually disappeared, leaving a nearly uncontested all-white Democratic Party in power. The national Democratic Party shielded away from issues of race because its strong Southern base had disproportionate seniority-based influence in Congress. The Republican Party was restrained by its more general ideological caution about governmental action. And blacks themselves were largely politically inactive.

In the early 1960s, however, liberals and Democrats began to assert leadership on civil rights, and the parties began to polarize around racial issues. In 1963, the Kennedy administration was somewhat reluctantly pulled into the increasing confrontations between Southern authorities and civil rights activists. Matters escalated quickly, however, and by 1965, landmark civil rights legislation was in place, providing federal guarantees for equal opportunity in a wide variety of domains. Its goal was to remove racial discrimination and to establish a race-blind standard. As Martin Luther King, Jr. said, the hope was that people would be judged by “the content of their character” rather than “the color of their skin.” An “intent” standard was set: a violation of equal opportunity could be proven only by demonstrating a specific perpetrator’s deliberate intent to achieve a discriminatory outcome. However, the new laws and affirming court decisions met with much white resistance. It soon became apparent that proving intent in the thousands of daily decisions made by state and local authorities was beyond the capacities of federal agencies or the courts. As a result, beginning in the late 1960s, new techniques to combat continuing racial discrimination began to be employed. They began to replace the “intent” standard with an “effect” standard: a rule could be defined as discriminatory even when it appeared neutral on its face as long as it could be shown to systematically reduce representation of blacks. This naturally increased the intrusiveness of the federal government on behalf of the black population in both the private sector and local government activities. And these policies were potentially especially politically vulnerable because they often were generated by court decision or administrative regulation rather than through legislation (James and Williams 1989, 234; Thernstrom and Thernstrom 1997).

In fact, in domain after domain, negative reaction has subsequently set in, from the courts, Congress, and conservative presidents. School desegregation was initially the most visible issue. By the late 1960s, it was apparent that previous decisions had been insufficient to desegregate Southern schools. As a result, the Supreme Court began in a series of unanimous decisions starting in 1968, to accept proof of mere de facto segregation rather than insisting on proof of intent to segregate. A 1971 decision mandated busing as a desegregation tool, which triggered similar judicial orders throughout the nation. Busing was, however, vastly unpopular among whites. The resulting protest quickly led to a limit on large-scale busing plans, perhaps most visibly in a 1974 decision voiding a metropolitan busing plan in the Detroit area. Conflating busing to the city limits allowed “white flight” to largely white suburban schools and perpetuated the de facto segregation of predominantly black schools in central cities.

The 1964 Civil Rights Act set up an Equal Employment Opportunity Commission to carry out the color-blind elimination of racial discrimination in employment. However, it had no powers of enforcement and so proved to be relatively ineffective. Here, too, government officials concluded that little change would occur as long as intent to discriminate had to be proved and turned to the effect standard. In 1970, racially proportionate hiring targets were mandated for all federal contractors. In 1972, Congress allowed for class-action suits, which soon motivated employers to meet federal guidelines for
proportionate hiring voluntarily. However, here, too, an increasingly conservative Supreme Court began to pull back in the late 1980s.25

Almost all affirmative action programs in college admissions have been voluntary. They expanded greatly in the 1970s. In the Bakke v. Regents of the University of California case in 1978, the Supreme Court outlawed explicit racial quotas, though still allowing race to be used as one factor among many in admissions decisions. But in the Hurdoco v. Texas case in 1996, it ruled out preferential standards of Hurdoco v. Texas. This case set a statewide initiative to eliminate affirmative action by state and local governments in California, including by public universities.26

Guaranteeing blacks' right to vote had been a central objective of the civil rights movement. The 1965 Voting Rights Act had placed federal officials in specific districts with histories of discrimination in order to facilitate black voter registration. Although this greatly increased black voter registration, the number of black elected officials still did not rise in proportionality. When this act was removed in 1982, as discussed above, the number of black elected officials fell far short of proportionality. When the Supreme Court ruled that the Voting Rights Act was no longer necessary in 1982, the number of black elected officials fell far short of proportionality. Congress and the Justice Department agreed that legislative redistricting plans should be required to maximize the number of "majority-minority" districts, with the goal of increasing minority representation. This, too, was ultimately reversed by the Supreme Court, in Shaw v. Reno in 1993 (Thernstrom and Thernstrom 1997, 426).25

Finally, the question of "multiculturalism" in educational curricula has pitted cultural minorities' desire for recognition and respect against the goal of assimilating all Americans to the broader society. Controversy has arisen over using languages other than English, especially when they are not taught in courses for the general student body, and other cultural traditions, requiring courses in cultural studies. It has even occasionally rewritten the curriculum entirely, as in "Afrocentric" curricula that reinterpret traditional disciplines from an African perspective. These debates also raise more fundamental questions about the treatment of other groups, especially with respect to the groups (Glenner 1997, treatment, and state neutrality with respect to groups) (Glenner and Cuthman 1996).26

Effect standards for the elimination of discrimination, often now described as "race-conscious" remedies, have been intensely debated. Supporters argue that institutional racism and whites' resistance to change have been so deeply and subtly embedded in the entire fabric of American society that little would have changed if more proactive methods had not been used. They argue that demanding findings of intent is beside the point or even a mere distracting excuse; what is needed is proof of equality. Opponents have argued that race-conscious remedies may in fact not have been necessary because substantial progress was already well under way and that such policies actually have slowed racial progress by angering otherwise sympathetic whites (Thernstrom and Thernstrom 1997, 538; Sniderman and Fiazza 1995).

PUBLIC OPINION ON RACIAL ISSUES

In a democracy, a natural question about such a long-standing public conflict is what the public wants and why. Addressing those questions is our primary purpose in this volume.

THE JIM CROW BELIEF SYSTEM

A formalized ideology of white racial superiority began to develop in the years prior to the Civil War, in response to abolitionist challenges to slavery. After Emancipation, the Jim Crow system of legalized discrimination and segregation gradually took hold over the later years of the nineteenth century, built on the foundations of that white supremacist ideology. By all accounts, it was broadly accepted in the South and indeed was quite common throughout the nation before World War II.

It had three major components. One was "racialism," the belief that blacks were inherently inferior to whites because of their race. A second was a formal pattern of social distance and segregation, such that blacks were supposed to "stay in their place," separate and subordinate to whites, especially in public. Public facilities were racially segregated, and blacks and whites were not to be personal friends or to date or marry. A third was a legalized pattern of discrimination, such that blacks were not allowed to vote and were provided with separate and inferior schools, while whites were given preference in employment and elsewhere.25

This belief system came under attack from intellectuals in the 1930s and 1940s, capped most visibly in 1944 by Gunnar Myrdal's The American Dilemma.25 Fortunately, an early survey by the National Opinion Research Center in 1942 provides benchmark data against which later changes can be measured. Since then, white support for all three elements seems to have precipitously declined. Here we draw principally on the most complete analyses available, those of Schuman and others.

could reverse three centuries of structural racism in that region and if the white population's educational level continued to rise throughout the nation, ill-educated older whites, steeped in the racism of an earlier day, would gradually be replaced by a new generation of college-educated youths, enlightened by modern social science. Cohort replacement all by itself might gradually erase the Jim Crow ideology.

Current surveys sustain that expectation (Schuman et al. 1997). White public opinion has indeed come to fully repudiate the Jim Crow doctrines so common half a century ago, as we have seen. The way was led by younger, college-educated, and Northern whites (Schuman et al. 1997; also see Glaser and Gilens 1997). This racial caste system had lasted for about 350 years, but it was almost entirely dismantled in the 25 years following World War II. Surrendering it was a truly momentous change in our society, and it came about in a relatively short period of time.

PERCEPTIONS OF DISCRIMINATION
Whites were not blind to the racial double standard that infected our society. As shown in table 1.1, a 1963 about half of the whites (49 percent) believed that blacks in their community did not have as good a chance as whites “to get any kind of job for which they are qualified.” But today most whites appear to believe that racial discrimination is no longer a significant factor. For example, 66 percent of the white respondents in the 1996 GSS said that racial differences in jobs, income, and housing were “mainly due to discrimination.” In a 1997 Gallup poll, 81 percent believed that blacks have as good a chance as whites in their own local job market, while 79 percent said that in their community “black children have as good a chance as white children to get a good education,” and 83 percent said that they have “the same chance to get any housing they can afford” (Gallup Poll Social Audit 1987).

On this point, blacks and whites part company. Blacks consistently perceive more discrimination and less equal opportunity than do whites. In 1996, blacks were twice as likely to believe that socioeconomic gaps between the races were “mainly due to discrimination” (Schuman et al. 1997, 157, 200). Blacks were far more likely to perceive unequal opportunity in the local job market than were whites (by a 53 percent to 19 percent margin) and more likely to perceive unequal educational and housing opportunities in one's own community as well.26

FEDERAL POLICIES
As we have seen, substantial racial gaps remain in most social, economic, and political indicators of well-being. But what, if anything, government should do about them remains a matter of great controversy. Despite whites’ increased support for general principles of formal racial equality, they have long been quite divided about the desirability of federal intervention to accomplish such goals. Even government intervention to overcome formal discrimination was highly controversial in the 1960s. In 1964, 63 percent felt that black and white children should go to the same schools, while only 47 percent felt that the federal government should ensure that they did. Similarly, 55 percent felt that blacks should have the same chance at any kind of job, but only 43 percent felt the federal government should intervene to ensure it. These contrasts can be seen by comparing tables 1.1 and 1.2.27 The white public was then deeply divided about whether the federal government should be involved in guaranteeing equal opportunity.

As indicated earlier, frustration over the ever-changing maneuvers of their opponents led government officials to propose policies that would go beyond guaranteeing equal opportunity and actually ensure greater equality between the races. These have often been described as “outcome-oriented” or “race-conscious” policies because more evidence of numerical inequalities between the races can trigger remedial action. As can be seen in table 1.2, whites are generally more strongly opposed to these policies than to those that seem to ensure only equal opportunity. Throughout the 1970s and early 1980s, fewer than 20 percent of white adults usually supported busing children to ensure school integration. Opponents typically outnumbered supporters of special help for blacks and other minorities by a two-to-one margin. Special preferences for blacks in jobs and in admissions to higher education have generally been opposed by most whites, and by large margins. Similarly, experimental studies have shown that targeting programs specifically for blacks rather than for poor people in general or using race-conscious as opposed to more universalistic justifications for social programs significantly increases white opposition (Schuman et al. 1997, 123–24, 175; Robo and Kluegel 1993; Sniderman and Carmines 1987a).28

These racial policy proposals not only now draw more opposition than do general principles of racial equality, but also have not shown

nately lead to greater liberalization. In contrast, blacks strongly support such racially targeted policies, though with more ambivalence about so-called race-conscious policies. This necessarily produces considerable racial conflict about such policies. The contrasts between these two types of issues, and between white and black opinions, represent the starting point for the debates drawn together in this volume. It presents and extends those debates with the hope that we will all better understand our people, our nation, and perhaps even ourselves.

THEORETICAL MODELS OF WHITE OPINION

Explaining opposition to liberal racial policies among whites has been the subject of extensive research and intense debate among American social scientists over the past quarter-century. Here we try to summarize the most prominent alternatives, underlining the areas of strongest controversy. Our intent is to present these alternatives in as impartial a fashion as possible, though surely our own involvement in some of these debates will ensure that we will fall short of that hope.

These models fall into three general categories. The first grows out of the long tradition of sociopsychological analysis of racial prejudice. Such models usually begin with the assumption of early-life socialization of prejudice and racial values and also rely on contemporary theories of cognitive processing. The second grows out of the sociological focus on social structure, emphasizing group differences in power, status, and economic resources as the prime movers. Ideology is often treated as a justification for such group interests. The third focuses particularly on the politics of race. It suggests that public opinion on racial policy is now primarily motivated by values and ideologies that are race-neutral. As a result, whites' opinions are strongly influenced by the exact nature of the policy proposals under consideration.

SOCIOPSYCHOLOGICAL MODELS

A variety of sociopsychological perspectives share the assumption that formal racial equality is now a settled issue in this society. But they also suggest that racism has not disappeared; instead, it has taken new forms. They differ about the nature of those new forms and about how racism interfaces with values and attitudes that have no manifest racial content.

SYMBOLIC RACISM, MODERN RACISM, AND RACIAL RESENTMENT

One alternative is that such a new form of racism lies behind much of whites' contemporary opposition to racial policies and black political candidates. This originated with David Sears and Donald Kinder's finding that Jim Crow racism had already been repudiated so broadly outside the South by 1969 that it was no longer a useful predictor of whites' political preferences. Instead, they found that other racial attitudes, described as reflecting "symbolic racism," were strongly associated with whites' votes against the black candidate in the close Los Angeles mayoral race in that year (Sears and Kinder 1971).

This evolved into a more general theoretical position. The new form of racism has been variously described as "symbolic racism," "modern racism," or "racial resentment," reflecting slightly different interpretations of the same general reasoning and measurement. This theory embodies several general propositions. First, older forms of racism now predict attitudes toward racial policy or voting behavior only weakly, in part due to the decline in support for them. Second, despite that decline, the socialization of negative affect and stereotypes about blacks continues, leaving a reservoir of racial antipathy decoupled from racist beliefs. Third, blacks are perceived by many whites to violate such cherished American values as the work ethic, self-reliance, impulse control, and obedience of authority. The new racism is said to derive from a coalescing of negative racial affect with the perceived violation of such traditional values. Finally, the content of the new racism includes the beliefs that discrimination no longer poses a major barrier to the advancement of blacks, that blacks should try harder to make it on their own, that they are demanding too much, and that they are too often given special treatment by government and other elites (see Kinder and Sanders 1996; Sears 1986; Sears et al. 1997; Sears, Henry, and Kosterman this volume).

In a variety of empirical studies, this new racism has been found to make large contributions to explaining whites' attitudes toward racial policy and voting preferences in elections with black candidates, over and above the effects of such alternative predictors as Jim Crow racism, political ideology, party identification, individualism, authoritarianism, or demographic variables (see Kinder and Sanders 1996; Kinder and Sears 1991; McCaughan 1996; Sears et al. 1997). Furthermore, whites' opposition to racial policies or black candidates generally does not reflect a response to real personal racial threats, such as having school-age children in a district with busing or feeling personally vulnerable to being victimized by black crime. These latter findings challenge interest-based accounts of whites' racial attitudes (Sears and Funk 1991).
The symbolic racism approach has stimulated its share of controversies. The major critiques are that the various components of symbolic racism do not represent a coherent belief system, that it is intransparent and not the coherent belief system often discussed in the literature. One of the major criticisms is that symbolic racism is merely tautological because both measure attitudes toward race relations is merely tautological because both measure attitudes toward race relations and the need for whites to maintain their dominant status quo. Second, it seems clear that neither symbolic racism nor racial policy preferences are much influenced by racial threats to whites personally (i.e., self-interest). But the role of whites' shared group interests in maintaining the racial status quo may have been underestimated. This point, too, is addressed by research in this volume.

Subtle, Aversive, and Ambivalent Racism. Other forms of symbolic racism have been described in related, but somewhat different terms. While the theory of symbolic racism has been criticized as too specific to the United States, Thomas Pettigrew and Roel Meertens have developed an analogous approach that would explain racism in Europe as well as the United States. They suggest that blatant prejudice is being supplanted in both areas by subtle prejudice, which is comprised of the defense of traditional values, the exaggeration of cultural differences, and the absence of positive emotions toward outgroups. Using a large, multinational survey, they provide evidence that subtle prejudice is indeed distinct from (though still related to) blatant prejudice, relatively distinct from political conservatism, and useful in predicting attitudes toward policies relevant to outgroups, such as policies about immigration (Meertens and Pettigrew 1997; Pettigrew this volume; Pettigrew and Meertens 1995).

Aversive racism theorists similarly believe that the decline of old-fashioned racism is genuine and that most whites now are genuinely committed to the principles of racial equality. But, as in the theory of symbolic racism, whites continue to have lingering negative feelings toward blacks. This conflict between egalitarian values and antiblack affect causes anxiety and discomfort, especially in the presence of black people. Such whites therefore are motivated to avoid blacks so that they will not be confronted with their own racist feelings (Gaertner and Dovidio 1986; Kovel 1970).

In this view, whites' avowed dedication to the principles of racial equality is real. In situations that unambiguously call for the application of principles of racial equality, whites will generally respond in nonprejudiced ways. However, in more ambiguous situations, their anxieties about African Americans may lead to the avoidance of interaction. For example, some studies of helping behavior have demonstrated discriminatory behavior against African Americans when the situation offers nonprejudiced explanations for it. When other people are available to help, declining to help a distressed black person can be justified in nonracial terms (Pry and Gaertner 1986; Gaertner and Dovidio 1977). This theory has not been applied to the case of whites'
Covert Racism. A further perspective is that extensive racism still persists, but that new, post-civil-rights-era, normative prescriptions now mute its overt expression. That is, even those with underlying prejudiced beliefs understand that the public expression of racism is no longer acceptable in most circles and usually comply with that norm, at least overtly. A number of sociopsychological methods have yielded evidence of such a dynamic. For example, whites attached to a supposed lie-detector apparatus (e.g., a "bugsy pipeliner") express more negative attitudes toward African Americans than they do on a standard self-report questionnaire (Sigall and Page 1971). Whites interviewed by black interviewers express less negative racial attitudes than they do to white interviewers (Kinder and Sanders 1996; Schuman et al. 1997). In experimental studies, whites show evidence of covert racism in terms of nonverbal leakage of antipathy toward African Americans, including greater waiting distance from them, less time voluntarily spent with them, less eye contact, less verbal fluency, an altered tone of voice, and even variations in electromyographical impulses (Crosby, Bromley, and Saxe 1980; Vanman et al. 1990).

In another line of work, social psychologists have increasingly reported that social behavior and judgments can be mediated by cognitions outside of conscious awareness. Implicit, automatic, or nonconscious racial attitudes may therefore be mediated by processes that are relatively unavailable to the individual's own introspection. Such processes are typically measured in terms of the relative accessibility of positive or negative responses to race-related stimuli, such as category labels or pictures presented subliminally. Implicit racial attitudes thus measured are presumably automatically activated in the presence of race-related stimuli (Devine 1989; Dovidio et al. 1997; Fazio et al. 1995).

Though this area clearly represents a promising new avenue of exploration, a number of questions remain. First, studies of the relationship between implicit racial attitudes and "explicit" measures (such as the standard measures of prejudice found in survey studies) have generated somewhat mixed results to date. Second, some interpret the implicit measures of racial attitudes as bona fide "pipelines" to an individual's true racial attitudes, circumventing biases introduced by social desirability and self-presentation (e.g., Fazio et al. 1995). Others suggest that implicit measures instead themselves represent a different type of racism, a set of overlearned, negative, affective associations to blacks (Devine 1999). Third, this research was primarily stimulated...
by the theory of aversive racism, so it has generally focused on predicting whites' direct interpersonal responses to blacks, such as their nonverbal behaviors. More conscious and deliberative political judgments about racial issues may be better predicted by standard self-report measures of racial attitudes, such as those normally used in survey research (Dovidio et al. 1987).

Because these effects occur automatically and outside of awareness, and even among people low in "explicit" racism, the continued impact of racial attitudes may be even more pervasive than would be clear from considering self-report measures alone. However, there is evidence that implicit racial attitudes may not always be fully activated; that they may in some circumstances be activated, but not applied in judgment; and that processing goals and self-representational concerns may influence their application (Blair and Baas 1990; Fazio and Dunton 1987). Even taking into account such effects, the results so far suggest that the socialization of prejudice may be more insidious and more difficult to undo than often hoped.

**Social Structural Theories**

A second set of theories reflects a sociological emphasis on social structure and group interests. These theories generally share the view that individuals identify with their own racial and ethnic groups, that the competing interests of these groups generate intergroup conflict, and that dominant groups develop ideologies to justify and legitimate their hegemony. Whites' opposition to racially liberal policies thus flows principally from the process of protecting their own interests.

**Realistic Group Conflict**

Donald Campbell organized a number of theories of intergroup relations in anthropology, psychology, and sociology into a general "realistic group conflict theory." He concluded that intergroup attitudes and behaviors tend to reflect the nature of the intergroup interests and the relationship between the groups' material interests. If the interests of the groups coincide, intergroup attitudes should be relatively positive. If the groups are competing over limited resources, intergroup attitudes should be more negative. From this perspective, whites' political responses to racial issues should be driven by zero-sum competition with blacks for jobs, promotions, admission slots to sum competition with blacks for jobs, promotions, admission slots to colleges, government contracts, or other goods. Thus, their opposition to racially ameliorative policies—and their antipathy toward civil rights movement, its leaders, and even blacks themselves—can be explained by the threat blacks pose to whites' privileges (Campbell 1965).

A heavy concentration of blacks may be particularly likely to stimulate a sense of collective threat among whites. V. O. Key Jr., noted that the most racially conservative Southern political candidates in the Jim Crow South tended to receive their strongest support from whites living in areas most populated by blacks, presumably because white hegemony was most vulnerable in such areas (1949). Such racial context effects continue to be noted today under the rubric of power theory, especially in the Deep South. For example, in the early 1980s, white voting for the racist candidate for governor and senator in Louisiiana, David Duke, was highest in areas of greatest black voter registration (Giles and Backner 1993, 1995).

Real conflicts of interest may be sufficient to cause negative intergroup attitudes, but they may not be necessary. Relative deprivation theory argues that the perceived discrepancy between one's actual circumstances and others' circumstances may be a stronger determinant of dissatisfaction with one's lot in life than is the absolute level of deprivation. In other words, the mere perception of group deprivation may be sufficient to trigger group antagonism; real conflicts of interest may not be necessary (Vanneman and Pettigrew 1972). Social identity theorist go still further. Tendencies to give favored outcomes to fellow ingroup members and discriminate against outgroup members can occur even in experimentally formed groups without any history of conflict or competition over limited resources, or indeed any prior interaction or relationship with other ingroup members. In fact, such ingroup favoritism exhibits itself even when the randomness of their assignment into such groups is completely transparent to participants (Tajfel and Turner 1980). This perspective has not yet been widely applied to the study of public opinion on matters of race, but it has influenced some theoretical perspectives in the area.

A further distinction between self-interest and group interest has proven important. A considerable body of research has found whites' racial policy preferences to be little affected by their own self-interest in such racial issues. Individual whites whose own lives are most affected by issues such as busing, affirmative action, or the like turn out to be more opposed to such policies than are whites who are not personally affected at all. However, whites' opposition to liberal racial policies may be more closely related to their sense of how the policy
might affect their own group's interests. That is, a sense of group interest may be more important than any sense of individual self-interest. The same is true for relative deprivation. Fraternal deprivation—the sense that one's own group is deprived relative to other groups—is more politically influential than egoistic deprivation—the sense that oneself is deprived relative to other salient individuals (Vanman and Pettigrew 1972).

The sense of group position. Much current work is developing a variant of the group conflict perspective, treating prejudice as flowing from an “idea of group position.” In this view, “the real object of prejudice is to maintain the relative group position” (Bobo, Kluegel, and Smith 1997, 38). This model contains a number of basic tenets. First, people differentiate themselves from others through the use of group categories, accompanied by a belief in ingroup superiority. Second, ingroup members view themselves as being similar to others through the use of group categories, accompanied by a belief in ingroup superiority. Third, members of dominant groups come to believe that such membership confers legitimate rights to superior status, power, and other resources. Finally, dominant group members readily perceive threats from members of lower-status groups who desire a greater share of those resources. Thus, the sense of group position model is similar to that of others. This model rests on the idea that those controlling the group’s position are the ones with the most at stake and that those groups perceive their position to be in danger.

Two general kinds of evidence have been provided for such perspectives. First, whites tend to oppose liberal racial policies more than do blacks, even with controls on a wide variety of demographic, ideological, and racial attitudes. Second, whites have a higher rate of belief in a God who rewards and punishes people. The more the sense of group position model is used to explain behavior, the more likely it is that a group's position will be threatened by other groups. Thus, the sense of group position model is a good example of the way in which the group conflict perspective is applied to the study of race and ethnicity. The group conflict perspective is used to study the relationship between group position and group conflict.

The conceptual boundary between this model and the new racism models is not always sharp, however. On the one hand, proponents of the new view critique some measures of symbolic racism as reflecting group interests or their rationalization. On the other hand, symbolic racism theorists find that the sense of group position model largely ignores the focus on realistic group interests and tangible threats in favor of constructs that can be construed as more symbolic. Lawrence Bobo’s more recent concept of “laissez-faire racism” elaborates further on the sense of group position model. It places the transformation of racial attitudes more fully within its historical context, tracing the ultimate decline of old-fashioned racism back to the demise of labor-intensive agriculture in the South. Such an ideology was no longer required without a continuing need to justify whites’ exploitative use of blacks as low-wage agricultural labor. However, that economic change did undo whites’ sense of entitlement to their privileged group position relative to blacks. Thus, a new form of racism developed to defend whites’ dominant position within the changed economic context, in which blacks became participants in the broader national economy that is based on free market capitalism. Laissez-faire racism therefore consists of two major components: the continued negative stereotyping of blacks and the placing of responsibility for the socioeconomic racial gap on blacks themselves. In this form, blacks’ primary shortcoming is no longer some inherent inferiority, but their cultural resistance to the work ethic. Like the modern racism perspectives, this theory predicts that new racism is distinguishable from old-fashioned racism. It is a better predictor of racial policy preferences, and is closely linked to beliefs about the socioeconomic stratification system. An important distinction between the perspectives, however, lies in the purported source of the change in racial attitudes discussed earlier. Laissez-faire racism is not a new brand of racism, but instead reflects the transformation of whites’ group interests and their continued defense of those interests. In contrast, the modern racism perspective focuses on the continuing socialization of negative affect toward blacks and perceptions that they violate cherished American values.
group-based social hierarchies. Dominant groups enjoy a disproportional amount of power, status, and economic privilege relative to subordinate groups. Both the categorization into groups and the ascription to dominant and subordinate positions are regarded as arbitrary and socially constructed. The theory suggests that there are three broad categories of such hierarchies: age-based, in which "adults" dominate "children"; gender-based, in which males dominate females; and a third category that varies across societies, based on race, ethnicity, nationality, social class, lineage, or clan. While age and gender systems are said to be found in all social systems, the third system of social hierarchy is thought to be restricted to those societies producing sustainable economic surplus (i.e., simple horticultural, advanced agricultural, agrarian, industrial, and postindustrial societies).  

The heart of social dominance theory concerns itself with identifying the psychological, ideological, and institutional mechanisms that produce and sustain these group-based social hierarchies. One of the most important individual-level forces in social dominance orientation, the desire to establish and maintain such social inequalities. It has been found to be related to many attitudes about policies that favor dominant groups and disadvantage subordinate groups. Such findings have been obtained in quite a number of different cultures and nations.  

Social dominance theory argues that group-based social hierarchies are driven by the interaction and reinforcement of mechanisms at one level of analysis (e.g., the psychological) with those at other levels of analysis (e.g., the institutional). For example, people with ethnocentric values are known to self-select into "hierarchy-enhancing" institutions, such as the military and the police. Moreover, such institutions tend to reward those employees who engage in antagisitarrarian behaviors toward members of subordinate social groups. Similarly, those with egalitarian values will be attracted to careers in "hierarchy-attenuating" institutions, such as social work or philanthropy. These attenuating institutions will tend disproportionately to allocate positive social reward most strongly those employees who exhibit such egalitarian behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups. As a result, institutional behavior toward members of subordinate groups.

Within social dominance theory, then, "the American dilemma" is simply a special case of more general forces that tend to maintain the relative hegemony of some social groups over others. While the specific operations and transactions that produce group-based social hierarchy will vary from one society and/or historical epoch to another, the underlying and essential hierarchical structure itself should be relatively invariant. Social dominance theorists suggest that better understanding the choreography of these underlying mechanisms will yield both a clearer understanding of the oppressive relationships among groups in general and greater insight into the dynamics of specific group conflicts within specific historical contexts.

Finally, a perspective advanced by Mary Jackman and her colleagues shares aspects of both realistic group conflict theory and social dominance theory. This also centrally features the ideas of an interest-based social hierarchy and the collusion of dominant and subordinate groups to promote stability and avoid conflict (Jackman 1978, 1994, 1990; Jackman and Mula 1984). In contrast with realistic group conflict theory, though, she suggests that dominant groups often attempt to maintain the exploitation of subordinate groups through ideology rather than through open conflict and force. They develop ideologies that justify existing inequalities as fair and just.

Thus, Jackman interprets whites' greater support for general principles of racial equality than for liberal racial policies as primarily reflecting their attempts to maintain their dominant position. A new ideology had to be constructed as the previous ideology began to lose utility. Furthermore, she argues that higher education does not increase racial tolerance. It simply makes whites more aware of their interests and more invested in maintaining their privileges. So more education only provides them with the ability to construct a superficial facade of commitment to equality, masking their underlying resistance to any real change. Thus, educated whites present themselves as unprejudiced without having to do anything that would jeopardize their political, social, and economic dominance over blacks.

Political theories  
A third general theoretical position, associated with Paul Sniderman and his colleagues, emphasizes politics more than it does psychology or social structure. This position arose primarily out of skepticism about the causal role of racism in determining opposition to contemporary racial policies as proposed in the new racism models. It focuses on the fact that citizens get to choose only among the political alternatives organized by political institutions and presented by public leaders. Therefore, it is important to look most closely at the nature of
those alternatives. This approach is thus "institution-oriented" rather than "actor-centered." However, these authors have generally not used a particular descriptive label, so we will simply describe it as a "politics-centered" approach.49

One proposition in particular stands at center stage: as far as whites are concerned, there is no longer the issue of race, no simple, emotional, gut-level response to any racial issue, driven by attitudes toward blacks themselves. Instead, the politics of race has evolved into a variety of distinct "policy agendas," such as equal treatment, social welfare for blacks, and race-conscious policies (e.g., affirmative action). Whites' attitudes vary considerably across these areas in three ways. Whites' attitudes vary considerably across these areas in three ways. Their level of policy support varies considerably, with opposition to affirmative action being most intense and pervasive (Sniderman and Carmines 1974). Their policy attitudes cluster within each area rather than reflecting consistent support or opposition to all racial policies across agendas. And opposition to each set of policies is determined more by its unique content than by racial animus or group interests. As a result, different predictive models are required to explain these differences.3

Most important, therefore, is general political ideology because values tend to frame all domestic issues in ideological terms. Conservatives and liberals differ especially in the degree to which government is perceived to be the central explanatory factor in whites' political behavior. In the political attitudes cluster within each area rather than reflecting consistent support or opposition to all racial policies across agendas. And opposition to each set of policies is determined more by its unique content than by racial animus or group interests. As a result, different predictive models are required to explain these differences.3

More recently these theorists have suggested that prejudice may actually be a stronger political force among liberals than among conservatives. Even nonprejudiced conservatives have principled, race-neutral reasons for opposing governmentally based racial policies, whereas prejudiced liberals are torn between their ideological preference for governmental solutions and their prejudice against blacks. They provide evidence both that prejudice has a larger impact on the racial policy attitudes of liberals than on those of conservatives and that liberals show more hesitation in expressing their attitudes toward racial policies, presumably due to their ambivalence. They suggest that liberalism is in crisis because elites' support for race-conscious remedies has generated a great deal of "acknowledged anger" in the rank and file (Sniderman and Carmines 1974a, chap. 3).

Indeed, so far from race being the quintessentially intractable issue on which white people are immovably pro or con, these theorists argue that the public can be more easily swayed about racial policies than previously supposed, if convincing moral arguments are made, because attitudes toward racial policy are at heart about politics and not race. They argue for a political representation by liberals because the liberals' race-conscious policy agenda has made things worse, not better. Policies like affirmative action violate traditional American values because such policies are exclusive and race-targeted. They suggest a shift to more universally held color-blind policies, with justifications that appeal to moral principles reaching beyond race. They...
provide experimental evidence that particularistic policies have limited appeal irrespective of which particular group they are targeted for. More broadly targeted policies with universalistic justifications are for. Moreover, they provide evidence that such a conjunction holds special appeal to political conservatives. Such findings would seem to be quite similar to those central to the new racism theories.

Others have also carried out research that specifically challenges some of the tenets of this political approach. First, despite vastly different levels of support for different racial policies, factor and regression analyses suggest that they still share an underlying racial component, whether that be racial antipathy, symbolic racism, or group-based antipaternalism. In addition, racial attitudes continue to have strong effects on whites' racial policy preferences even when ideology and other political values are controlled (e.g., among many others, Hughes 1997; Pettigrew and Meertens 1980; Sears et al. 1997). Second, this research also has provided evidence that conservative values and racism are in fact substantively related. Some go as far as to suggest that, due in part to the political party realignment around civil rights issues, racism and conservative political values are now inextricably intertwined (for discussion of this realignment, see Carmines and Stimson 1989; Edsall and Edsall 1991a). Third, as education increases, so does the relationship between racism and ideology, as well as the impact of new forms of racism on attitudes toward racial policy (see, e.g., Sears et al. 1997; Siderius, Pratt, and Bobo 1996). Fourth, some have begun to contest the notion that a substantial opposition to race-conscious policies stems from a sense that such policies violate color-blind principles of racial egalitarianism. Instead, one usually finds that commitment to egalitarian values strongly predicts support for almost any kind of racial policies (see Hughes 1997; Sears, Henry, and Kosterman this volume; Siderius et al. this volume; Sniderman, Crosby, and Howell this volume).

However these puzzles end up being resolved, this more political approach has played an important role in reviving research on ideological and other political values as sources of opinion on racial policy. More important, it has provided research outlining one possible political framework for placing America back on the path to racial equality.

**CROSS-CUTTING THEMES**

These theories intersect at several points that it might be useful to underline prior to previewing the original contributions that follow.
The Roles of Race and Racism

There is substantial disagreement among scholars about the extent to which the term "racism" is appropriately applied to contemporary whites' attitudes. Some see racism as having largely disappeared, along with the formal barriers to equality. Others see it as continuing, but in altered form, as some kind of "new racism." There is even disagreement about whether these "new racists" are in fact much different from the "old racists" or indeed about whether they reflect racism at all. In addition, there is some disagreement about the form any such new racism takes.

A central question is whether or not race and racism have major influences over whites' attitudes toward racial policy. Most have answered yes, but for different reasons. Perhaps most extreme are the implicit racism theorists, who suggest that racism matters a great deal and in ways that are outside the awareness and control of even the most egalitarian-minded individuals. The symbolic and aversive racism perspectives suggest that the power of racism can now be found in a conjunction of primitive affective responses to blacks and traditional but nonracial values, while biological racism is a matter of the past. The social structural theorists assert that race matters, but primarily as an expression of other forces, such as realist conflicts of group interest or the desire to maintain the ingroup's position in the social hierarchy. At the other extreme, the politically centered theory says that race matters, but more for questions of principle than policy, and that then mainly for the less educated.

There is general consensus about two aspects of the empirical data on this point. One is that blacks are far more supportive of contemporary racial policies than are whites. A second is that the "new racism" racial policies than are whites. A second is that the "new racism" measures are quite closely correlated with whites' attitudes toward race.

Races and Ideologies

Symbolic racism theorists see them as the consequence of the linkage of racial resentment and ideology stimulated by political elites in the post-Civil Rights era. Aversive racism theorists see them as the acceptable expression of latent negative affect toward blacks. Group-interestable expression of latent negative affect toward blacks. Group-interestable expression of latent negative affect toward blacks. Group-interestable expression of latent negative affect toward blacks. Group-interestable expression of latent negative affect toward blacks.
mony. In contrast, politically oriented theorists argue that it composes principles of self-governance reached through careful consideration and education and plays a central causal role in determining attitudes toward racial policy. In the middle, perhaps, are new racism theorists, who see components of conservative ideology as intertwined with racism, but with both making independent contributions to racial policy preferences.27

Beliefs about the causes of inequality similarly play a major role in a number of perspectives. According to social structural theories, they provide dominant groups with justifications for the current state of inequality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. In fact, equality and the maintenance of a privileged group position. The denial of discrimination and the absence of structural explanations of inequality as justifications for opposition to racial policy.28 This position has culminated in the model of laissez-faire racism, which puts the denial of discrimination and stereotypes about blacks' lack of effort at center stage. Symbolic racism similarly invokes the denial of continuing discrimination and perceptions of blacks' lack of work ethic, though conceptualization and perception of racism as such a key contributor to whites' tension and anxiety about blacks. In the politics-centered view, egalitarianism plays a dual role. Among conservatives, the commitment to color-blindness should be related to opposition to race-conscious policies, such as quotas or set-asides. But among liberals, egalitarianism should be related to support for such racial policies. And, of course, it plays an especially central role in social dominance theory, in the form of social dominance orientation, an individual-difference measure of one's desire to increase or maintain group-based social hierarchy. Much of the empirical work on egalitarianism has also used a single measure (again, see Feldman 1988). It consistently has strong correlations with attitudes toward racial policy.29 Another standard measure of social dominance orientation also is closely associated with racial policy preferences.40 However, the reinterpretation of egalitarianism by Sears and his colleagues in this volume suggests that multiple factors are at play. One potentially reflects "pure" egalitarianism—support for equal treatment—while a second reflects resistance to further advances toward equality, resembling racial resentments and perhaps coming closer to individualism than to what most people think egalitarianism is. Plainly, the field would also benefit from further deconstruction of egalitarianism and careful measurement of its different components.30
INTERNETS

The sociopolitical and sociological approaches to intergroup conflict perhaps collide most around the question of interests. The symbolic racism theory, taking a symbolic politics perspective, argued that self-interest (that is, personal racial threats) were not strong motivators of whites’ racial attitudes. Realistic group conflict and politics–centered theorists criticized the symbolic racism perspective for emphasizing the role of self-interest and ignoring group interests, which were said to be more central to political life in general (compare Sears and Funk 1991; Sniderman and Tetlock 1986b). Much subsequent theoretical and empirical work has emphasized the importance of the distinction between the two kinds of interests, with even group conflict theorists now concurring in the general weakness of self-interest (see Bobo 1985; this volume; Hughes 1997).

Nonetheless, questions remain about the notion of group interests at both the theoretical and the empirical levels. Most obvious, most assume that blacks have a strong interest in the objectives of liberal racial policies: more equality in employment, education, housing, business, and so on. Also, Sears and Kinder offer a distinction between symbolic and realistic group interests (Sears and Kinder 1985). The line has not been sharply defined, however. Even resources as seemingly tangible as money, political power, or territory have their symbolic elements (e.g., Lane 1991). And the sense of group position theory places more emphasis than realistic group conflict theory on status and other more symbolic, intangible goods.

At a measurement level, there is tension about the use of objective indicators of interests as ignoring real perceived interests and/or insufficient direct measurement of those perceived interests (see Bobo 1983, as opposed to Sears and Kinder 1985). Identification with the white ingroup, for example, has not been much explored, and some are skeptical of interpreting the racial differences in policy preferences that remain after controlling on a wide variety of other variables as reflecting differential group interests. There is consensus here at the moment, then, that focusing on group interest is more profitable than an emphasis on self-interest. But there remains considerable theoretical and empirical work to be done.

THIS VOLUME

As with American race relations in general, the contributions in this volume represent a mixture of progress and continued conflict. The chapters that follow represent the major theoretical positions concerning whites’ attitudes toward race and racial policy. They show surprising convergence about the important variables and the most critical unresolved issues. Moreover, they provide a sampling of the sophisticated theory and methodology that are increasingly the standard for this field. They also reflect the growing trend toward examining the attitudes of groups other than white Americans, a crucial step to developing broader theory and deeper understanding. Despite this growing consensus, substantial and heated disagreements remain. We believe that such debates provide the competitive pressure that has led, and will continue to lead, to the continued refinement of our understanding of “the American dilemma.” Chapters 2 through 9 present research by protagonists in these debates that helps to develop and crystallize points of similarity and difference from other perspectives. All of them present research original to this volume. Chapters 10 through 12 present comments by experts in American racial politics who have not themselves been involved in these debates. They provide the valuable perspectives of outside observers. We here briefly review the chief contributions each chapter makes to the ongoing debates.

Donald Kinder and Tali Mendelberg tackle the critically important conundrum of the role of individualism in racial politics. Despite its centrality to most historical accounts of Americans’ values, it has consistently had less predictive value in explaining whites’ attitudes toward racial policies than the new racism theories would suggest. These authors suggest that individualism has actually become a part of prejudice, in the form of racial resentment. It became incorporated into the expression of prejudice as whites increasingly abandoned old-fashioned racism in the aftermath of the 1960s and instead became preoccupied with black Americans’ individualistic shortcomings. They demonstrate the importance of racial resentment and its specifically racial nature in three ways. First, they provide a detailed reanalysis of previous work by Sniderman and Michael Hagen (1985). They show that racially oriented individualism was a potent component of opposition to racial policy, but not to policies focusing on class or gender. In contrast, they find that standard measures of race-neutral individualism do not influence attitudes on racial policy issues, although they do have some effect in domains that are not explicitly racial. Second, using a quite different research approach, they show that people talk about racial resentment, but not individualism, when they are asked to think about racial policy. In contrast, other kinds of domestic policy
David Sears, John Hett, and Ei Sidanius build on the general consensus that symbolic racism is the most powerful ingredient of opposition to racial policy. But they note the vexing question of its origins. Does it really stem from a mixture of racism and traditional values, or is it something else? And what is the role of the individual in manifesting its connection to race? First, of egalitarian values that are manifest in symbolic racism? They provide additional evidence that symbolic racism is distinct from the attitudes of whites' attitudes, in particular, and of whites' attitudes, in general. However, it appears to more closely associated with inequalities. A deconstruction of attitudes than with those of symbolic racism. If equality yields overwhelming support for the principles of equality, then it is certainly a further reason to promote equality, and much division about how far to promote further equality in practice. They find that egalitarianism as ordinarily further equality in practice.

Marylee Taylor uses the effects of racial context as a way to assess the role of whites' racial sentiments in influencing their racial policy preferences. Combining survey data and Census information, she measures the size of the black population in the white respondents' environments. As it increases, does white antipathy toward blacks on such dimensions as traditional prejudice, attitudes toward racial policy, racial resentment, perceived group threat, and individualistic attributions to black disadvantage. In contrast, racial context is not related to attitudes about nonracial social policies. She concludes that such findings strongly suggest that opposition to racial policy is in fact based on racial considerations, and perhaps on racial threats. She anticipates, as do we, further research that outlines the processes that lead to such observed effects of racial context.

Lawrence Bobo highlights and expands three points about public opposition to affirmative action. First, many different types of social policy are grouped under the category of "affirmative action," and whites are not equally opposed to all of them. Second, beliefs about its costs and benefits, though a substantial part of the public debate, have not been carefully examined in studies of public opinion. Third, the role of group interests in attitudes toward racial policy has been substantially underestimated because the attitudes of blacks and other minorities have too often been ignored. He finds substantial differences among racial/ethnic groups in their attitudes toward affirmative action: blacks, Latinos, and Asians are more favorable than whites, while Asians' attitudes tend to resemble whites'. Moreover, these differences survive controls on various attitudinal and demographic variables, suggesting a role for group interests. Bobo finds little evidence that such differences are moderated by education, contrary to Sniderman's politics-oriented theory.

Michael Hughes and Steven Tuch, like Sears and his colleagues, explore individualistic and structural attributions for poverty. Most important, their analysis of stratification ideology is broadened by examining the views of Asian, Hispanic, and black as well as white respondents and by examining how they apply it to Asian and Hispanic poverty as well as black poverty. They find that whites are the least likely to make structural attributions. However, whites are also less likely (though not to the same degree) to make individualistic attributions. These differences generally hold irrespective of target groups. They also find, as expected, that structural attributions contribute to more liberal racial policy preferences. More surprising, they find that individualistic attributions cancel these effects of structural beliefs, so they, too, suggest renewal of the role of individualism. In common with other authors, they find substantial effects of racial resentment and, to some degree, political conservatism. Finally, they find substantial group differences that survive controls on a host of attitudinal and demographic variables and, like Bobo, conclude that perceived group interests may play a more substantial role in support for racial policy than previously thought.

Jim Sidanius, Pam Singh, John Hett, and Chris Federico carry out a critical comparison of social dominance theory with Sniderman's po-
tical theory. They find that egalitarianism remains a systematically contested issue rather than being a resolved, consensual, and noncontested feature of American politics. The greater the general social status of one's ethnic group is, the less committed one is to social mobility rather than equality of opportunity rather than equality of result. In two studies, they find opportunity to be equally or even more strongly associated with racial pes-

in the content of an impressive multinational survey of prejudice in Europe. Focusing on the responses of the majority groups in each nation, Pettigrew finds that four basic dimensions underlie prejudice: political di-

533. Recent developments in models strongly support for social dominance theory than for

cial policies, finding that support for open housing is much influenced by the specific arguments used to justify such policies. Finally, they provide their own views of areas of agreement and areas of disagree-

ticism. Thomas Pettigrew takes on the important task of simplifying the vast number of theoretically and empirically suggested predictors of outgroup prejudice. Furthermore, he conducts these analyses in the context of an impressive multinational survey of prejudice in Europe. Focusing on the responses of the majority groups in each nation, Pettigrew finds that four basic dimensions underlie prejudice: political dis-

engage government, lower social class, traditional conservatism, and lack of

532. For example, ideology had stronger effects when the policy was targeted for blacks, suggesting a close link between race and ideology. Also, highly educated conservatives were, if anything, more likely to exhibit a racial double standard than were highly educated liberals. In both studies, comprehensive structural equation models yielded stronger support for social dominance theory than for

parable scholar's "bilingualism" by reading and thinking about the work of both white and minority researchers, while white researchers often tend to ignore the work of minority scholars. Moreover, white social scientists tend to "normalize" their own explanatory models as more "objective" and falling within the range of acceptable scientific discourse, while perceiving the work of minority scholars as politically biased and scientifically suspect. That may not only contribute to the fragmentation of the polity as a whole, but also make it more difficult for us all to understand the intersection between race and politics in American society. Much will be gained if social scientists, like ordinary citizens themselves, make a greater effort to listen to one another across the racial divide. This book is a modest effort in this direction.

**FINAL WORDS**

In 1903, W. E. B. Du Bois forecast that the defining problem of the twentieth century would be "the color line." By 1944, Gunnar Myrdal had issued a more optimistic prediction: that the color line was not an insurmountable divide because it rested on the fundamentally unstable contradiction of racial prejudice with core American values. Over half a century later, both points of view continue to have their vigorous adherents in American social science.

"Disagreement is a powerful engine of scientific advance. It sharpens conceptual boundaries, directs attention to neglected issues, and, of course, prompts the design of would-be decisive experiments" (Gilovich, Medvec, and Kahneman 1998, 602). We agree with this description of scientific debate. The debate in this field has sometimes been acrimonious, but it has yielded increasingly focused, refined, and testable theoretical perspectives on public opinion toward racial policy. In fact, we find that the debate in this very volume suggests a number of conceptual and theoretical refinements as well as a number of intriguing new directions. Our hope is that this volume will help establish and extend a dialogue that will lead to clarification, among scholars as among peoples of different national backgrounds, of different political preferences, and, yes, of different skin colors.
