Should scientists care about politics?

A RENOWNED scientist once told the author that the impact on real life of science can be astonishingly low. Critics argue that some of the so-called POLICY scientist are not only unhelpful, but are actively working against the goals of the scientific community.

On the one hand, politics can be seen as a way of addressing the shortcomings of science. On the other, politics leads to a lack of understanding of the true nature of science.

In fact, scientists have been known to influence public opinion on a wide variety of issues. They have been involved in the development of new technologies, the regulation of industries, and the protection of the environment.

On the other hand, science cannot be separated from politics.

Scientists need to understand how policy decisions are made, and how science can be used to influence these decisions. They need to be aware of the laws and regulations that affect their work, and how they can use science to advocate for changes in these laws and regulations.

Scientists also need to be aware of the ways in which political decisions can affect their work. For example, funding for scientific research can be affected by political decisions, and scientists need to be aware of how these decisions are made.

Scientists also need to be aware of the ways in which political decisions can affect their work. For example, funding for scientific research can be affected by political decisions, and scientists need to be aware of how these decisions are made.
