On January 23, 2019, Russell Toomey, an associate professor at the University of Arizona, filed a class action lawsuit against the state of Arizona because the university’s health plan for state employees categorically excludes coverage for sex reassignment surgery. Toomey is transgender and needs a hysterectomy, but because the indication is to support his gender affirmation (or transition), it is not covered. This exclusion, he argues, is sex discrimination under Title VII of the Civil Rights Act of 1964 and a violation of the Equal Protection Clause of the Fourteenth Amendment to the Constitution.

About 1.9 million American adults identify as transgender. A quarter of transgender adults have had gender-affirming surgeries, and as many as an additional 43% seek to undergo any one of a variety of gender-affirming surgeries. Access to these surgeries varies by income and insurance coverage level. Gender-affirming care — including surgeries and hormones — can be lifesaving for transgender people, improving mental health outcomes, reducing suicidality, improving general well-being and social engagement, and decreasing the risk of transphobic violence. Since the beginning of 2020, at least 37 transgender people have been murdered in the United States, most of them transgender women of color. Care that increases others’ recognition of one’s affirmed gender can directly save lives, and all major medical associations in the United States have endorsed the medical necessity of gender-affirming treatments.

The fate of Toomey’s case, and of many other transgender Americans’ access to care, depends on the influence of this summer’s Supreme Court ruling in the employment-discrimination case Bostock v. Clayton County. The Court held that the phrase “on the basis of sex” in Title VII includes protections against discrimination on the basis of sexual orientation and gender identity. In the majority opinion, Justice Neil Gorsuch wrote, “It is impossible to discriminate against a person for being homosexual or transgender without discriminating against that individual based on sex.”

The Bostock ruling bodes well for Toomey and all LGBTQ+ employees, including the 53% of transgender adults who have employer-based insurance. Employer health plans fall within Title VII’s employment discrimination reach, so plans that fail to cover gender-affirming care, including hormone therapy and gender-affirming surgery, could be deemed illegal under Bostock.

The picture is more complex, however, especially for transgender people who are not covered...
through employer-based insurance. Transgender people face a host of structural barriers to accessing gender-affirming care, including lack of insurance, coverage exclusions, coverage denials, and shortage of knowledgeable providers. Moreover, many transgender people avoid seeking care out of fear of discrimination.

Many of these barriers have fluctuated over the past decade as political support for transgender rights has seesawed with administration changes. The Affordable Care Act (ACA) expanded coverage options broadly for Americans in general.2 The anti-discrimination clause of the ACA (Section 1557) was interpreted by the Obama administration as including transgender people, and this interpretation has further increased coverage for transgender people and protected them from discrimination in health care. In the summer of 2020, the Department of Health and Human Services (HHS) revised the regulation to remove transgender protections, but after Bostock, the replacement rule that excludes protections for transgender people was blocked by injunction.

Since 2013, major shifts in health care coverage policies have favorably altered the landscape of transgender people’s access to care. Medicare, many state-regulated private plans, some state Medicaid programs, and an increasing number of employersponsored plans cover transition-related care for transgender people.3,4 These changes have greatly increased the ability of transgender people to access care specific to their gender and transition needs. Better access to care has been made possible by the ACA’s Medicaid expansion in many states, by removal of exclusions of transition care (thanks to requirements under Section 1557’s Obama-era rules and to voluntary corporate changes), and by the ACA’s ban on denials for pre-existing conditions such as transgender identity. Increased coverage has led to an expanding pool of providers by encouraging the creation of hospital-based transition-related programs, which are able to reap financial benefits from reimbursement for gender-affirming surgical procedures.

The Trump administration, disorganized in other policy areas, effectively produced damaging changes, as appointees removed transgender rights protections across domains from education to health care. Their replacement Section 1557 rule opens the door to widespread discrimination against transgender people in all areas of health care, from gender-affirming care to general, emergency, and primary care services. Furthermore, the prejudicial language of the rule undermines the reality of transgender people’s existence by restricting the meaning of “sex” to genetic sex at birth (a definition of little physiological or scientific value).

To match the strategy of dismantling patient protections, Trump administration officials added new protections in defense of the people who would deny care: so-called religious freedom and conscience rights, which now have their own Conscience and Religious Freedom Division in the HHS Office for Civil Rights. The judicial philosophy of newly confirmed Supreme Court Justice Amy Coney Barrett epitomizes this brand of hostility to LGBTQ+ rights. Her views, including expressed support for the dissent in the marriage equality case Obergefell v. Hodges and a stance against extension of Title IX protections to transgender people, are anchored in a Procrustean view of gender roles. Her confirmation moves the Supreme Court as far to the right as it has been in modern times, far out of line with the majority American view that sexual and gender minorities deserve to flourish as much as anyone else. The Trump administration has pitted religious rights and transgender rights against each other and then built these conflicts into our health care bureaucracy as well as into the Supreme Court majority.

Although the Supreme Court’s new conservative majority might not defend transgender rights, other opportunities arise in the other two government branches. The incoming Biden–Harris administration clearly supports transgender rights, but what exactly they can accomplish hinges on Senate control and thus on the runoff elections in Georgia. All Trump’s actions (except the justices he installed) are subject to modification by administrative regulations or executive orders or through congressional action. The Trump rules stripping transgender rights from ACA protection are most likely invalid under Bostock but can also be undone in Congress (albeit probably requiring Democratic Senate control) or unwound through the regular rulemaking process. More broadly, however, the constitutionality of the ACA’s individual mandate and of the law in its entirety are at stake in the California v. Texas case on the Supreme Court docket. Along with the ACA, the ability of many transgender people to receive care is at stake.

The new Congress and president must act to protect transgender rights. Such protection can be provided by clear legislation clarifying that “sex” discrimination includes gender identity.
and expression, as interpreted by the Supreme Court in Bostock. We believe that such legislation should apply to antidiscrimination law broadly, from health care to employment to jury duty. A new antidiscrimination law should require clear, affirmative coverage of transition-related care in all plans, including self-insured employer plans and the Veterans Health Administration’s TriCare plans (which currently exclude gender-affirming surgeries).

Other legislative fixes to the ACA at large can render the ACA challenge in California moot. Major legislation will probably require a Democratic Senate majority, however. Without it, administrative rulemaking and executive orders can protect transgender rights but in a more piecemeal fashion.

Either way, the medical profession has an ongoing obligation to act by expanding high-quality accessible care for transgender and nonbinary people. Our first steps toward that end include training, community-engaged care improvement and research, and a commitment to the creation of health care environments that are as welcoming for transgender and nonbinary patients as they are for cisgender people.

Failed Assignments — Rethinking Sex Designations on Birth Certificates

Vadim M. Shteyler, M.D., Jessica A. Clarke, J.D., and Eli Y. Adashi, M.D.

In 1900, the year the U.S. Census Bureau created the first iteration of the U.S. birth certificate, nearly all births occurred at home, often attended by family members and midwives without specialized training. During the 20th century, as the medical profession assumed greater responsibility for managing childbirth, it also assumed responsibility for completing birth certificates, a process that includes a medical evaluation to categorize each newborn as male or female. We believe that it is now time to update the practice of designating sex on birth certificates, given the particularly harmful effects of such designations on intersex and transgender people.

The birth certificate’s content has been changed several times over the decades, with the aim of collecting more useful public health information. The current birth certificate, which underwent its most recent revision in 2003, collects nearly twice as much information as the original. A revision to the document in 1949 created a line of demarcation. The legally identifying fields above the line appear on certified copies of birth certificates, whereas information in the fields below the line, which is used for statistical purposes, is deidentified and reported in the aggregate. Race and parents’ marital status, for example, were moved below the line of demarcation to permit self-identification and to avoid stigma, respectively.1

Recognizing that the birth certificate has been an evolving document, with revisions reflecting social change, public interest, and privacy requirements, we believe it is time for another update: sex designations should move below the line of demarcation.

Designating sex as male or female on birth certificates suggests that sex is simple and binary when, biologically, it is not. Sex is a function of multiple biologic processes with many resultant combinations. About 1 in 5000 people have intersex variations. As many as 1 in 100 people exhibit chimerism, mosaicism, or micromosaicism, conditions in which a person’s cells may contain varying sex chromosomes, often unbeknownst to them.2 The biologic processes responsible for sex are incompletely defined, and there is no universally accepted test for determining sex.

Assigning sex at birth also doesn’t capture the diversity of people’s experiences. About 6 in 1000 people identify as transgen-
der, meaning that their gender identity doesn't match the sex they were assigned at birth. Others are nonbinary, meaning they don't exclusively identify as a man or a woman, or gender nonconforming, meaning their behavior or appearance doesn't align with social expectations for their assigned sex.

Sex designations on birth certificates offer no clinical utility; they serve only legal — not medical — goals. Certainly, knowing a patient's sex is useful in many contexts, when it is appropriately interpreted. Sex modifies the clinical suspicion of a heart attack in the absence of classic symptoms and is a proxy for many undefined social, environmental, and biologic factors in research, for example. But, in each of these applications, sex is merely a stand-in for other variables and is not generally ascertained from a birth certificate.

Keeping statistical data on newborn sex may further public health interests. Moving information on sex below the line of demarcation wouldn't compromise the birth certificate's public health function. But keeping sex designations above the line causes harm.

For people with intersex variations, the birth certificate's public sex designation invites scrutiny, shame, and pressure to undergo unnecessary and unwanted surgical and medical interventions. Sex assignments at birth may be used to exclude transgender people from serving in appropriate military units, serving sentences in appropriate prisons, enrolling in health insurance, and, in states with strict identification laws, voting. Less visibly, assigning sex at birth perpetuates a view that sex as defined by a binary variable is natural, essential, and immutable. Participation by the medical profession and the government in assigning sex is often used as evidence supporting this view. Imposing such a categorization system risks stifling self-expression and self-identification.

People with intersex variations may undergo surgeries before they are old enough to consent, often losing reproductive capacity and sexual sensation as a result. Transgender people receive worse health care and have worse outcomes than cisgender people. Health care professionals have a particular duty to support vulnerable populations who have historically been harmed by clinicians and by the medical system in general.

Moving sex designations below the line would be in keeping with legal developments deemphasizing sex distinctions. Now that the U.S. Supreme Court has held, in *Obergefell v. Hodges*, that bans on same-sex marriage are unconstitutional, only a few legal contexts relying on sex designations remain. In these contexts, using information from birth certificates is not the best way to categorize people.

One concern might be that without information from birth certificates, enforcing separate men's and women's restrooms or locker rooms would be difficult. But fears about privacy and safety violations in public accommodations aren't supported by evidence. A study examining the effects of a Massachusetts law protecting transgender people in public accommodations revealed no increase in violations. Meanwhile, many intersex and transgender people avoid public spaces, including restrooms, for fear of mistreatment. Many establishments are moving toward gender-neutral facilities with more non-shared areas to promote privacy and respect modesty. Sex-specific sleeping quarters spark similar debates. After advocacy efforts, however, many correctional facilities have begun housing incarcerated people on the basis of gender identity.

Passports and state identification cards relying on sex assigned at birth for identification pose another challenge. These documents are usually issued or renewed when the holder is an adolescent or an adult, however, so moving sex designations below the line of demarcation on birth certificates would permit applicants to identify their gender without medical verification. Governments could also remove gender designations from identification cards altogether and focus more on identifiable physical features and updated photographs. This change would accommodate nonbinary people and reduce the burdens associated with amending documents.

Finally, governments can protect against sex discrimination in the absence of birth-certificate sex designations. Moving sex designations below the line of demarcation wouldn't imperil programs that support women or gender minorities, it would simply require that programs define sex in ways that are tailored to their goals. For example, the Wing, a women-focused workspace club, admits people who are committed to building a community to support women's advancement, regardless of their sex or gender identity. The International Association of Athletics Federations has defined “female” as a person with a testosterone level of 5 nmol per liter or lower, rather than relying on birth certificates. Although this definition is controversial, it has the benefit of making the goals and assumptions of
the policy transparent, thereby allowing for more effective public debate.

Moving sex designations below the line of demarcation may not solve many of the problems that transgender and intersex people face. Controversies regarding bathrooms, locker rooms, and sports participation will continue, regardless of legal sex designations. Still, updating the process for reporting sex on birth certificates could be an effective first step. Even if the government retains a dichotomous sex-classification system, the system would be based on self-identification at an older age, rather than on a medical evaluation at birth.

Many states now permit changes to sex designations on birth certificates, and some allow a third sex designation, “X.” Since most people with intersex variations identify as a man or a woman, allowing a third option to be assigned at birth could prove problematic. In most states, amending a birth certificate is very burdensome; only 9% of transgender people who want to update their gender on the document succeed in doing so. Some states reissue birth certificates on which original sex designations remain discernible.

Some intersex and transgender people benefit from the validation that changing a sex marker offers, but people could still have this opportunity if governments permitted optional sex designations on various identification cards. Leaving any sex designation visible on birth certificates sacrifices privacy and exposes people to discrimination.

In 1903, the American Medical Association defined the health care profession’s duty to maintain the accuracy of vital statistics. Today, the medical community has a duty to ensure that policymakers don’t misinterpret the science regarding sex and gender. Today, the medical community has a duty to ensure that policymakers don’t misinterpret the science regarding sex and gender identity and the possibility of genderless identity documents. Harvard J Law Gend 2016;39:491-554.

Interviewed while Black

Josh Ellis, M.D., Onyeka Otugo, M.D., M.P.H., Alden Landry, M.D., M.P.H., and Adaira Landry, M.D.

Inside a conference room with a long wooden table, a Black residency applicant sat next to 12 other applicants on interview day. None of their peers were Black. Across the table hung photos of faculty members, including the program director, medical director, and department chair. None were Black. In the corner of the room, administrators and coordinators were monitoring the agenda. None were Black. Rosters with descriptions and headshots of the faculty interviewees were distributed. None were Black. Later, residents spoke to applicants over lunch, and nurses sat at their workstations during the tour. None were Black.

During the course of the interview day, the Black applicant was asked whether they were lost and twice was assumed to be anyone but an applicant. They were told that they had an unusual name and that they were articulate. Their hair was critiqued.

At the end of the interview, the Black applicant wondered, “Do I fit in here?”

We believe it is time to critically discuss the ways in which various aspects of the interview day affect Black applicants at the student, resident, fellow, and faculty level. Although the application process involves many components, the interview day is a concrete opportunity to determine compatibility between the applicant and the program. According to the 2018 National Resident Matching Program survey, the factors considered by the most program directors to be important for ranking applicants were “interactions with faculty during interview and visit” (96%), “interpersonal skills” (95%), and “interactions with house staff during interview and visit” (91%). There are private consultants, textbooks, online resources, and workshops to help applicants improve their interviewing skills.
