WHAT DO EXPENSIVE NEW TELESCOPES DO FOR HUMANITY TODAY?

Are mega-projects like ALMA, LIGO, JWST, and Gaia worth the billions?

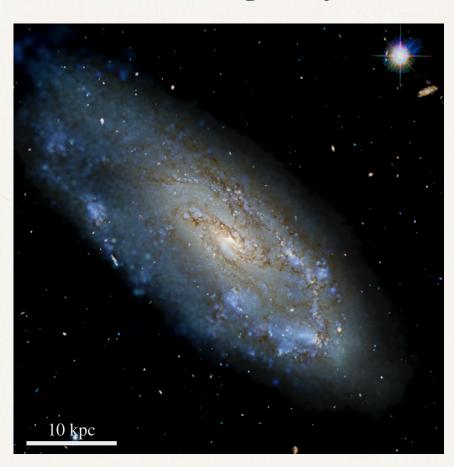

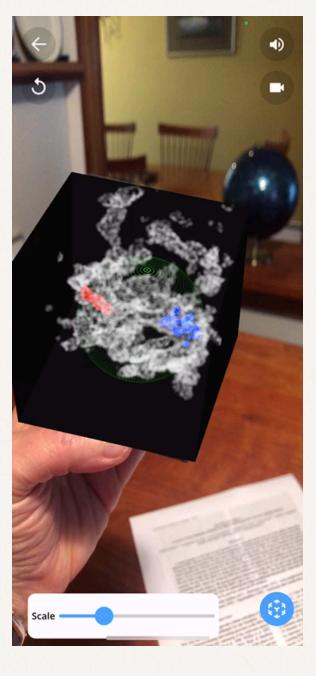

ARE COMPUTERS THE NEW TELESCOPES?

New galaxies in-silico, the early Universe "learned" without physics, and new stars forming in your hand.

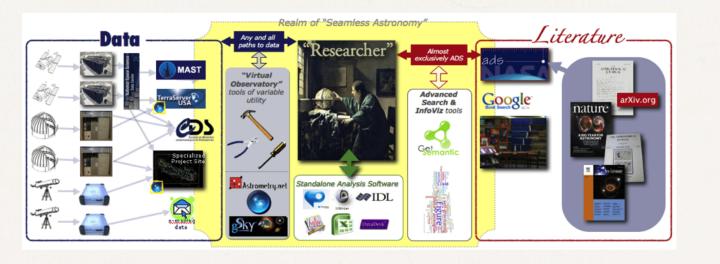

IS ASTROPHYSICS BEING (RE)ORGANIZED?

Lone stargazers are a rarer and rarer breed in professional astronomy. Teams and data scientists seem the way of the future, and tools that talk to each other are essential.

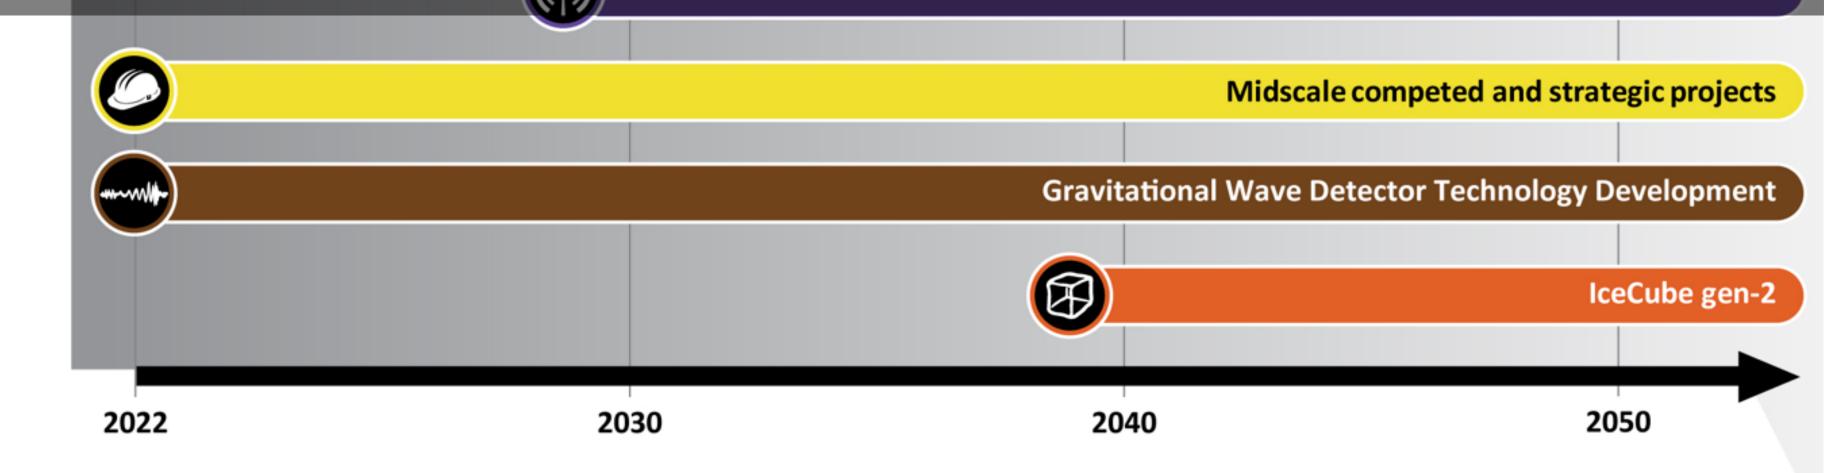

Key Category	ASTRONOMY IN 1992	ASTRONOMY IN 2022	SO WHAT?	
Discovery	The Universe is likely decelerating.	The Universe is accelerating.	Oh no, dark energy AND dark matter! Or MOND?	Nobel 2011
Discovery	gravity waves were theoretical		wide range of discoveries in studies of "compact" objects, where general relativity is best tested, observation of gravity waves	Nobel 2017
Discovery	no planets known beyond the Solar System, circumstellar disks barely detected	Thousands of exoplanets , brilliant images of disks forming them	(exoplanetology+exoclimatology+ astrobiology)=humans can legitimately study the Origins of Life in the Universe	Nobel 2019
Discovery	black holes were theoretical	black holes observed in the center of the Milky Way, and in other galaxies, using high-resolution time-resolved observations	significant tests of general relativity, all of which have been passed (no huge surprises—bad for MOND)	Nobel 2020
Technology	spectroscopy one spectrum at a time	MANY spectra at a time: focal-plane arrays, fiber-fed spectrographs, interferometers, IFUs	thousands or more spectra simultaneously, instead of 1 at a time give details on motion & composition of all components of the Universe	•
Technology	UNIX, LatTeX on Suns, MacOS best for graphics	Python on anything, many other languages, collaboration via Jupy er notebooks etc.	Astronomy=Data Science; HUGE wealth of new techniques enabling new discoveries (Bayesian statistics, Machine Learning, much more)	•
Technology	early supercomputers (CRAY)	uliq it us superfist chea high-personne com ulin	Similation and seed in "third branch" of astronomy be vold "observations" and "theory" multi-wavelength coverage, ultra-sharp, ultra deep images, w/n/ concern about atmospheric effects	•
Technology	IRAS success, Hubble launched, mirror flawed	numerous space missions, some HUGE (e.g. JWST)	multi-wavelength coverage, ultra-sharp, ultra deep images, w/n/ concern about atmospheric effects	•
			MUCH higher resolution, over wider areas	•
Technology	software one-offs, except for big projects	oper source nodular software	re-usable cede, "comless Astronomy"	•
		opersource nodular software computer gaplics for all, even treatile, and augmented reality		•
Technology	Exploratory Data Analysis: DataDesk	Exploratory Data Analysis: glue	Explore-Explain approach made possible by rich data interactions	•
Technology	glass plate archives, disks, tapes	Liter acces to "all" de (eg. WWS SA Sky et .)	"Sanda Astronomy" ad posible by read according to	•
	measurements		"Stank Astronom" and Describe by rich data interactions "Stank Astronom" and Describe by reached account the Minky Way's gas, dust, and stars, in true 3D (sometimes even 4D, 5D or 6D!)	•
lature of Science	interest in outreach du Son Carton see are scientists	The Das State of the Company of the	importes in S Comp. (Comp. Comp. Com	•
	, <u> </u>	X-ray images (Chandra launched 1999)	MUCH higher sensitivity in detectors, seeing "fainter objects"	
		remote telescope observing, queue scheduling	telescope access expanded, but students less well-trained in mechanics of observing	
	Astronomy ~80% white males	Fraction of non-white non-male astronomers ~40%	diversity of approaches to science and how to be a scientist, more role models	
		<u> </u>	improved data re-use and reproducibility; astronomy as a poster-child	•
Funding	funding proposal success 30-50%	funding proposal success 5-15%	much harder to secure funding; more time spent writing proposals	
Funding	expensive telescope= tens of millions (until Hubble)	expensive telescopes = billions	<i>fewer</i> opportunities for hands-on observing, and for training "instrumentalists" — higher and higher <i>stakes</i> for space-based missions	
Technology	glass plate measuring machines used to do "astrometry"	astrometry.net (2012), Gaia 2018	"register" positions of astrophysical sources and images with ease	
valure or science	typical collaboration size ~5 people at most, except large instrument projects	collaboration size often >>10 people, often international	difficulty in assigning "credit" to individuals

Star formation near the Sun is driven by expansion of the Local Bubble

https://doi.org/10.1038/s41586-021-04286-5

Catherine Zucker^{1,2⊠}, Alyssa A. Goodman¹, João Alves³, Shmuel Bialy^{1,4}, Michael Foley¹, Joshua S. Speagle^{5,6,7}, Josefa Groβschedl³, Douglas P. Finkbeiner^{1,8}, Andreas Burkert^{9,10}, Diana Khimey¹ & Cameren Swiggum^{3,11}

For decades we have known that the Sun lies within the Local Bubble, a cavity of low-density, high-temperature plasma surrounded by a shell of cold, neutral gas and dust¹⁻³. However, the precise shape and extent of this shell^{4,5}, the impetus and timescale for its formation^{6,7}, and its relationship to nearby star formation⁸ have remained uncertain, largely due to low-resolution models of the local interstellar medium. Here we report an analysis of the three-dimensional positions, shapes and motions of dense gas and young stars within 200 pc of the Sun, using new spatial⁹⁻¹¹ and dynamical constraints¹². We find that nearly all of the star-forming complexes in the solar vicinity lie on the surface of the Local Bubble and that their young stars show outward expansion mainly perpendicular to the bubble's surface. Tracebacks of these young stars' motions support a picture in which the origin of the Local Bubble was a burst of stellar birth and then death (supernovae) taking place near the bubble's centre beginning approximately 14 Myr ago. The expansion of the Local Bubble created by the supernovae swept up the ambient interstellar medium into an extended shell that has now fragmented and collapsed into the most prominent nearby molecular clouds, in turn providing robust observational support for the theory of supernova-driven star formation.

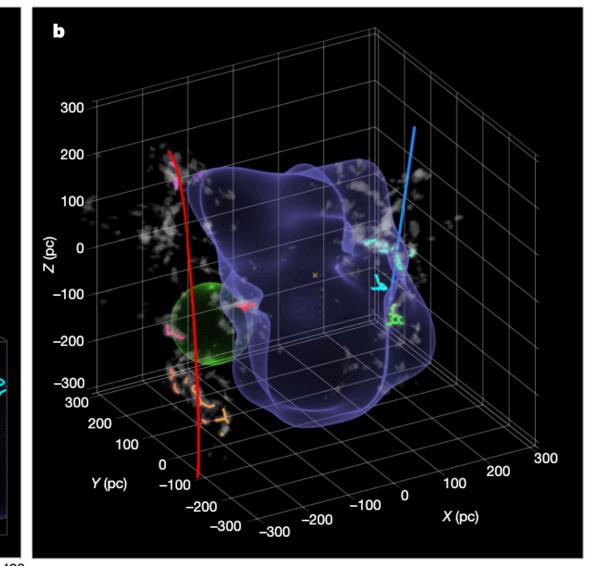

Fig. 1| **A 3D spatial view of the solar neighbourhood.** For the best experience, please view the online 3D interactive version available in Supplementary Fig. 1. **a**, A top-down projection of star-forming regions on the surface of the Local Bubble, whose young stars show motion mainly perpendicular to its surface. The surface of the Local Bubble ¹³ is shown in purple. The short squiggly coloured lines (or 'skeletons') demarcate the 3D spatial morphology of dense gas in prominent nearby molecular clouds ¹¹. The 3D arrows indicate the positions of young stellar clusters, with the apex of the arrow's cone pointing in the direction of stellar motion. Clusters are colour-coded by longitude, as in Extended Data Table 1. The Sun is marked with a yellow cross. The enlargement to the lower right shows a close-up of Ophiuchus, Pipe, Lupus and Corona

Australis on the bubble's surface, along with arrows illustrating the outward motion of their young stellar clusters. **b**, A 3D view of the relationship between the Local Bubble, prominent nearby star-forming regions and Galactic structure. The Local Bubble and cloud skeletons are the same as in **a**. We also overlay the morphology of the 3D dust (grey blobby shapes⁹) and the models for two Galactic scale features—the Radcliffe Wave (red)¹⁶ and the Split (blue)¹⁰. The Per-Tau Superbubble¹⁵ (green sphere) is also overlaid. The interactive version offers views from any direction (not just top-down), provides floating labels for star-forming regions and includes additional layers (some not shown in this snapshot), which can be toggled on/off.

AI-assisted superresolution cosmological simulations

Yin Li , Yueying Ni , Rupert A. C. Croft , and Yu Feng Authors Info & Affiliations

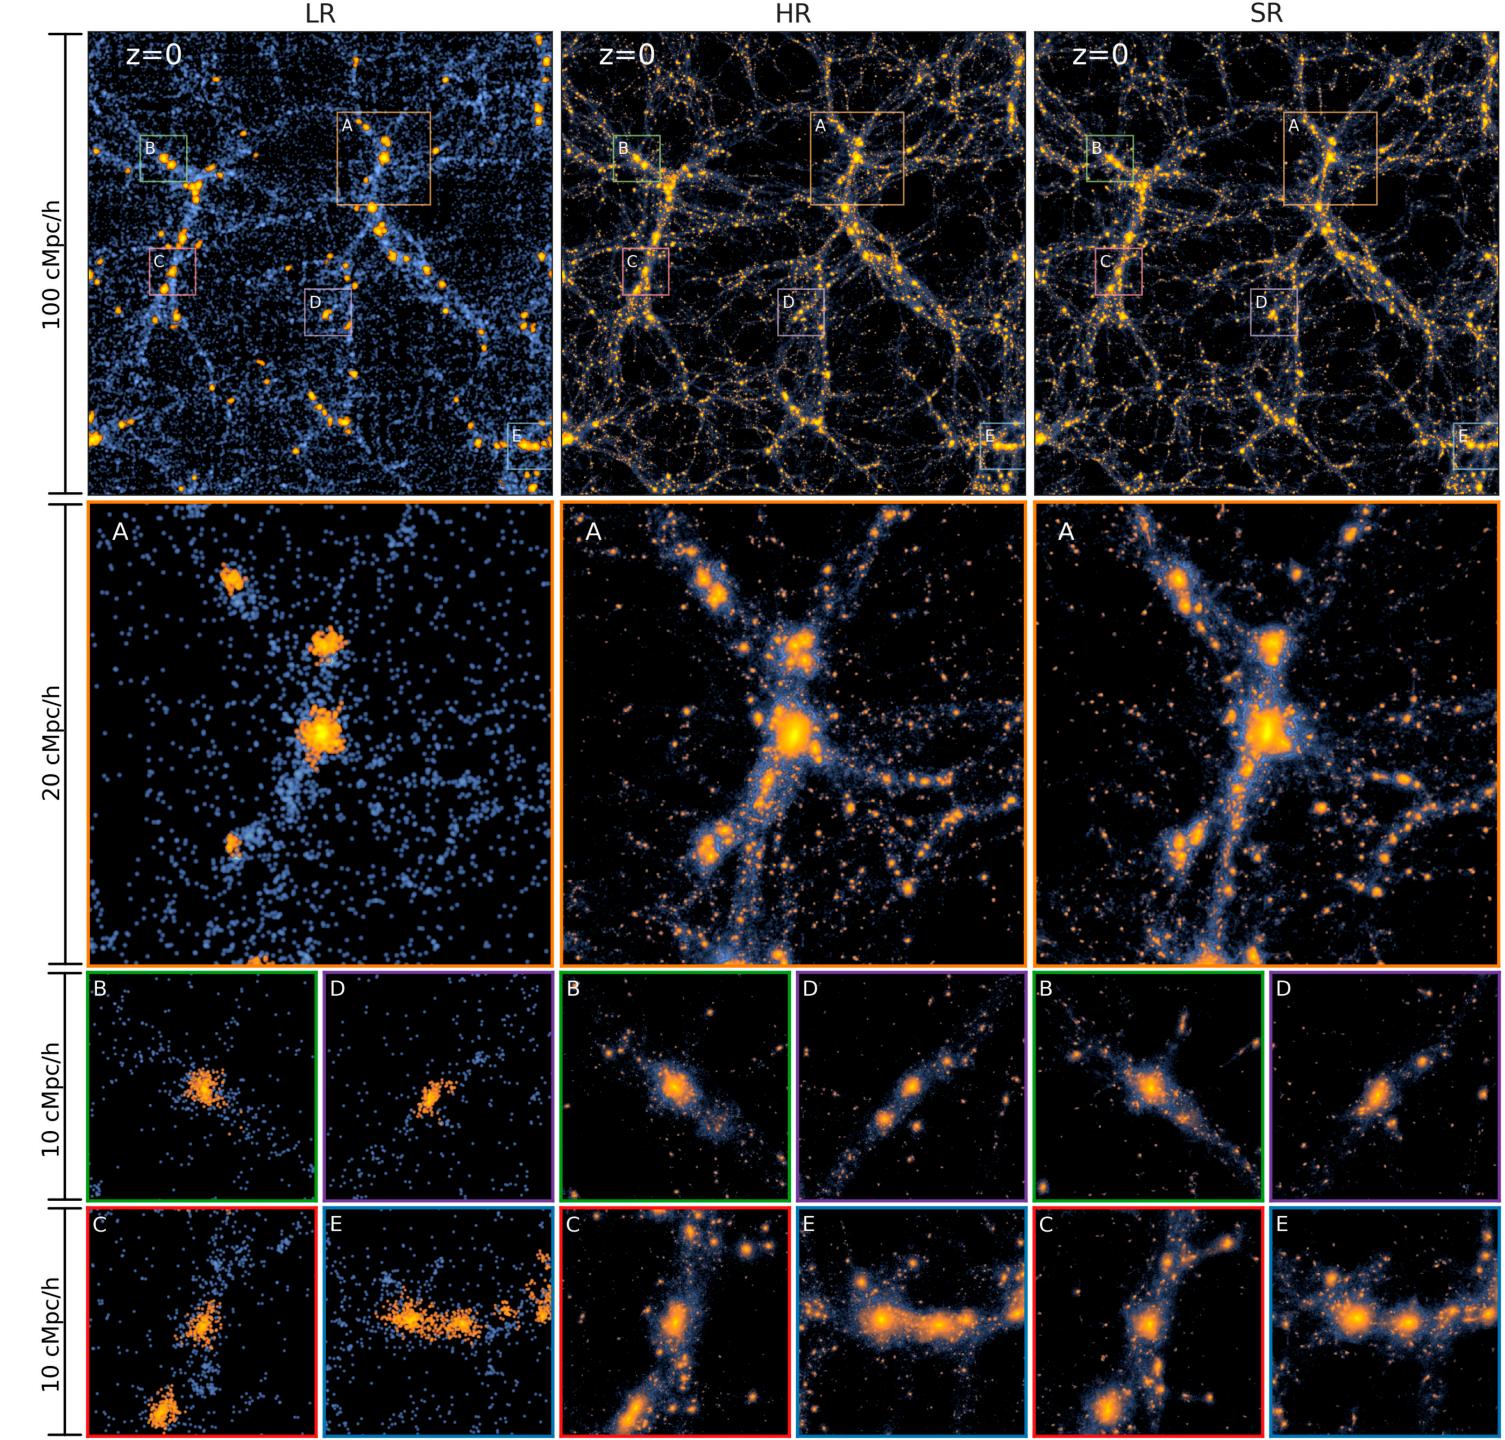

Edited by Neta A. Bahcall, Princeton University, Princeton, NJ, and approved March 11, 2021 (received for review October 26, 2020)

May 4, 2021 118 (19) e2022038118 https://doi.org/10.1073/pnas.2022038118

Significance

Cosmological simulations are indispensable for understanding our Universe, from the creation of the cosmic web to the formation of galaxies and their central black holes. This vast dynamic range incurs large computational costs, demanding sacrifice of either resolution or size and often both. We build a deep neural network to enhance low-resolution dark-matter simulations, generating superresolution realizations that agree remarkably well with authentic high-resolution counterparts on their statistical properties and are orders-of-magnitude faster. It readily applies to larger volumes and generalizes to rare objects not present in the training data. Our study shows that deep learning and cosmological simulations can be a powerful combination to model the structure formation of our Universe over its full dynamic range.

IS EINSTEIN'S THEORY OF GRAVITY ENOUGH?

Masses in the Stellar Graveyard

LIGO-Virgo-KAGRA | Aaron Geller | Northwestern

Japan is currently building a 3 km interferometer inside of the Kamioka mine (also home to the Super Kamiokande neutrino detector). Being underground, the detector will be exposed to much less seismic vibration than surface instruments like LIGO, Virgo and GEO600. **KAGRA** will also use cryogenic systems, meaning that the optics will be cooled to such a degree that molecular vibrations within the material itself will be brought almost to a stop (the key to detecting gravitational waves is to isolate the detector from any and all Earthly vibrations that might mimic or mask a gravitational wave vibration; that includes vibrating molecules in mirrors and their coatings). Full-scale operation of this observatory is expected to commence in 2020.

KAGRA's Y-arm under construction. (KAGRA)

Testing Einstein's theory of gravity from the shadows and collisions of black holes

by Ethan Payne, ARC Centre of Excellence for Gravitational Wave Discovery

Artist's impression of binary black holes about to collide. Credit: Mark Myers, OzGrav-Swinburne Univer...

General relativity, Einstein's theory of gravity, is best tested at its most extreme—close to the event horizon of a black hole. This regime is accessible through observations of shadows of supermassive black holes and gravitational waves—ripples in the fabric of our Universe from colliding stellar-mass black holes. For the first time, scientists from the ARC Center of Excellence for Gravitational Wave Discovery (OzGrav), the Event Horizon Telescope (EHT) and the LIGO Scientific Collaboration, have outlined a consistent approach to exploring deviations from Einstein's general theory of relativity in these two different observations. This research, published in *Physical Review D*, confirms that Einstein's theory accurately describes current observations of black holes, from the smallest to the largest.

Astronomers Gear Up to Grapple with the High-Tension Cosmos

A debate over conflicting measurements of key cosmological properties is set to shape the next decade of astronomy and astrophysics

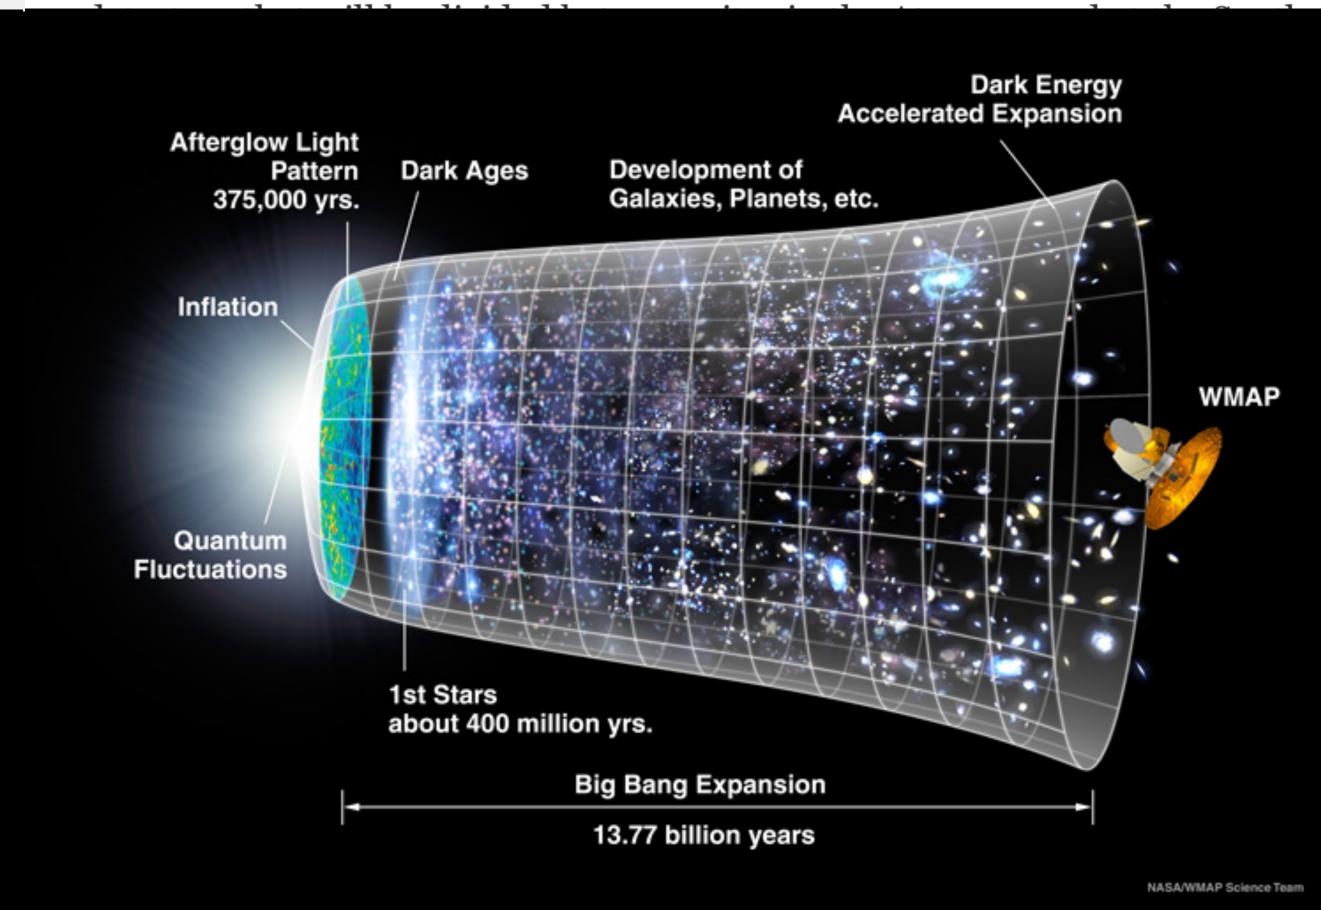

By Anil Ananthaswamy

"These twin tensions—between expectation and observation, between the early and late universe—may reflect some **deep flaw in the Standard Model of cosmology**, which encapsulates our knowledge and assumptions about the universe. Finding and fixing that flaw could transform our understanding of the cosmos."

JWST
Simons Observatory
CMB-S4

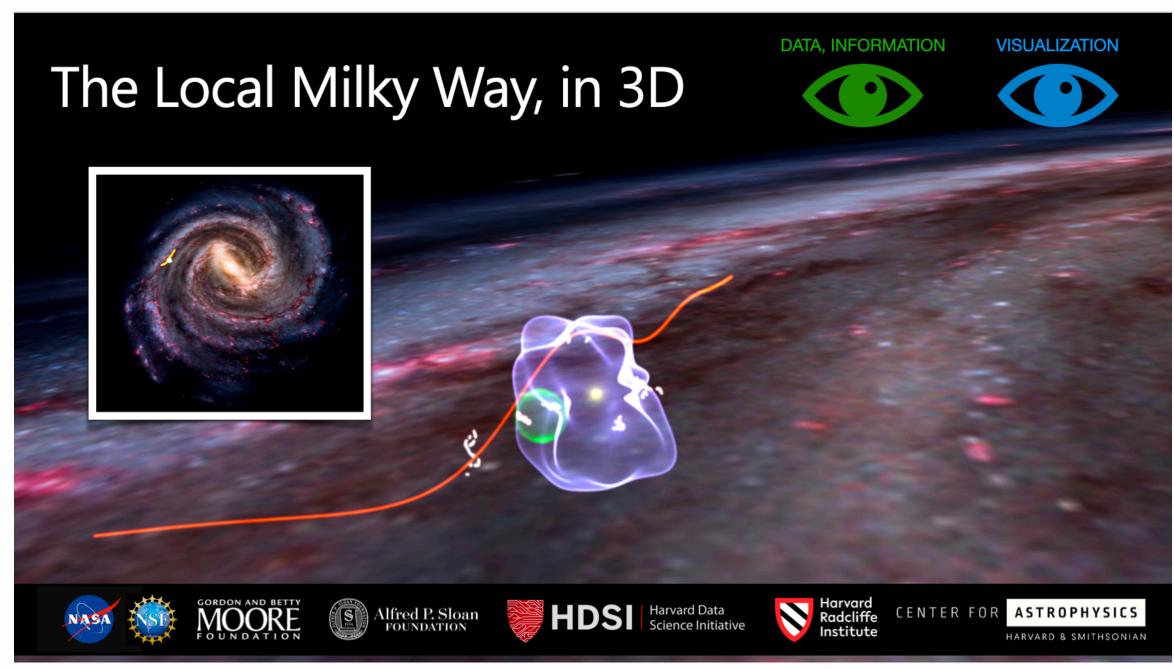

Euclid
Nancy Grace Roman Telescope
Vera C. Rubin Observatory

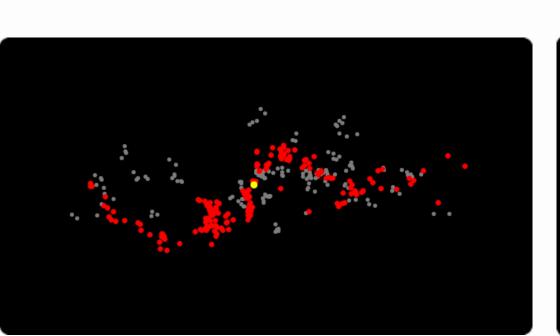

The third generation is only now starting to take the stage with the successful launch and deep-space deployment of Hubble's successor, the <u>James Webb Space Telescope</u> (JWST). On Earth, radio telescope arrays such as the <u>Simons Observatory</u> in the Atacama Desert in Chile and the <u>CMB-S4</u>, a future assemblage of 21 dishes and half a million cryogenically cooled

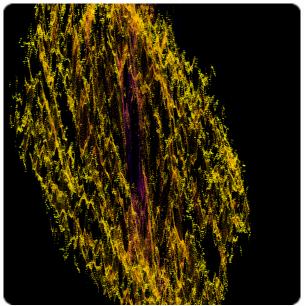

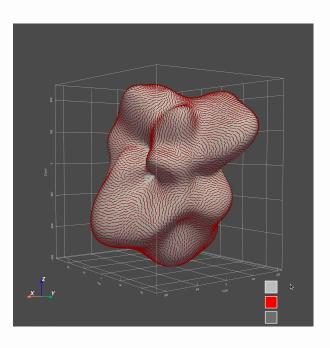

because these are independent observatories," says astrophysicist Priyamvada Natarajan of Yale University. "Even if we have a systematic in our framework, we should [be able to] figure it out."
