## Mediating a work conflict (source: radicalmath.org)

We have this information concerning wages at a fictional company:

| Number of people <br> in each position | Position | Yearly <br> individual salary | Total salary <br> per position |
| :---: | :---: | :---: | :---: |
| 1 | President | $\$ 200,000$ | $\$ 200,000$ |
| 3 | Vice Presidents | $\$ 100,000$ | $\$ 300,000$ |
| 5 | Managers | $\$ 50,000$ | $\$ 250,000$ |
| 10 | Supervisors | $\$ 30,000$ | $\$ 300,000$ |
| 11 | Workers | $\$ 28,000$ | $\$ 308,000$ |
| 20 | Workers | $\$ 20,000$ | $\$ 400,000$ |
| 22 | Workers | $\$ 18,000$ | $\$ 396,000$ |
| 6 | Workers | $\$ 16,000$ | $\$ 96,000$ |

The union leader, who represents the 59 workers of the company, claims the average yearly salary is $\$ 18,000$ and suggests all workers get a raise of $\$ 7,000$ a year. How did the union leader obtain such an "average"?

The company owners claim the average yearly salary in the company is $\$ 28,846$. They propose each worker receive a raise of $\$ 1,000$ a year. How did the company owners obtain this "average"?

We have this information concerning wages at a fictional company:

| Number of people <br> in each position | Position | Yearly <br> individual salary | Total salary <br> per position |
| :---: | :---: | :---: | :---: |
| 1 | President | $\$ 200,000$ | $\$ 200,000$ |
| 3 | Vice Presidents | $\$ 100,000$ | $\$ 300,000$ |
| 5 | Managers | $\$ 50,000$ | $\$ 250,000$ |
| 10 | Supervisors | $\$ 30,000$ | $\$ 300,000$ |
| 11 | Workers | $\$ 28,000$ | $\$ 308,000$ |
| 20 | Workers | $\$ 20,000$ | $\$ 400,000$ |
| 22 | Workers | $\$ 18,000$ | $\$ 396,000$ |
| 6 | Workers | $\$ 16,000$ | $\$ 96,000$ |

The union leader, who represents the 59 workers of the company, claims the average yearly salary is $\$ 18,000$ and suggests all workers get a raise of $\$ 7,000$ a year. How did the union leader obtain such an "average"? \$18,000 is actually the mode: the most frequent salary.
The company owners claim the average yearly salary in the company is $\$ 28,846$.
They propose each worker receive a raise of $\$ 1,000$ a year. How did the company owners obtain this "average"? This is the mean of everyone's salary.

## On "Averages"

Given a set of $n$ data points $x_{1}, x_{2}, \ldots, x_{n}$, we have:

- The mean $\bar{x}$ ( "x bar") is the sum of all the data points, divided by the number of points:

$$
\bar{x}=\frac{x_{1}+x_{2}+\ldots+x_{n}}{n}
$$

- The mode is the most frequent value appearing in the data points.
- The median is the number "in the middle" once the list has been ordered from smallest to largest.

We also have a measure of the spread of the data, given by the standard deviation $\sigma$ ("sigma"), which is related to how far are the data points from the mean:

$$
\frac{\left(x_{1}-\bar{x}\right)^{2}+\left(x_{2}-\bar{x}\right)^{2}+\cdots+\left(x_{n}-\bar{x}\right)^{2}}{n}
$$

## Can we describe all our data using just a few numbers?

Here a few questions to ponder for today:

- Can you find two sets of three numbers that have the same mean but look very different?
- Can you find two sets of three numbers that have the same mean and the same standard deviation but look very different?
- Can you find two sets of 10 numbers that have the same mean but look very different?
- Can you find two sets of 10 numbers that have the same mean and the same standard deviation but look very different?

Challenge: can you find a set of 10 different $(x, y)$ points such that the mean of the $x$ 's is 9 , the standard deviation of the $x$ 's is 11 , while the mean of the $y$ 's is 7.5 ?

Super Challenge! Can you find two different answers to the above challenge, that look very different?!

## Anscombe's Quartet (1973. Source: Wikipedia.)

This is Anscombe's Quartet, demonstrating the importance of graphing data and the effects of outliers on statistical properties.
