# Tax Simplicity and Heterogeneous Learning 

Philippe Aghion<br>(College de France)

Ufuk Akcigit
(Chicago)

Matthieu Lequien<br>(Banque de France)

Stefanie Stantcheva (Harvard)

## Motivation: The Value of Tax Simplicity

Hard to design policies that fulfill intended goals, minimize hassle, and remain simple enough to be understood.

Complexity of policies can be "regressive"
If hurts low income, low educated most.
The very people targeted by transfers may be unable to take advantage of them.

Often low take-up due to information: sometimes good for revenues, often bad for social welfare.

Tax simplicity $=$ conceptual + practical simplicity.
"Simple" $=$ easy to understand and handle.
Low cognitive, low attention, and low logistical burdens.
Can refer to a given policy (e.g., claim a given subsidy), set of policies, or tax system as a whole.

## Research Questions

We ask two related and complementary questions:
For any given policy, do people respond only to the monetary incentives of that policy or does its "simplicity" come into consideration as well?

How much do they value simplicity?
Is there a costly learning process about complex tax systems?
Are certain agents quicker to learn and understand?

## Setting: Self-Employed in France

Self-employed are good group for studying effects of simplicity:
Can adjust their own income more easily.
Direct map between their own understanding and their choices (no "employer" in between).

France is a good quasi-laboratory with valuable policy variation:
Three fiscal "regimes" for the self-employed which differ in monetary incentives and tax simplicity.

Regimes have changed a lot over time.
They impact different agents heterogeneously (even conditional on same income).

## New Administrative Data

New tax returns from the French Internal Revenue Service 1994-2012.
Annual sample of 500,000 households 1994-2012.
Full population data for 2011 (36 million households).
Extending as we speak to full population for 2007-2012.

All income streams (individual \& household) + demographics.

Sample of 100,000 tax returns per year matched to large-scale survey with education, occupation, social insurance benefits data.

Panel of all businesses (entry, exit, startups).

## Strategy and Findings (I): Value of Simplicity

Simpler regimes are subject to eligibility thresholds: "notches".
People "bunch" at those thresholds because they value the fiscal advantages and the simplicity.

The change in payoff an agent faces at the thresholds varies a lot:
across people (because of activity type \& tax bracket) and over time (policy changes).

Key variations in policy parameters give us many "data moments:"
Use excess mass to back out i) income elasticity (standard) and ii) value of tax simplicity (non standard).

Find large preferences for tax simplicity: 150 to 600 euros per year (up to 60 hours at net of tax median wage). Small income elasticities.

## Strategy and Findings (II): Costly, Heterogeneous Learning

Use variation of thresholds over time and introduction of new regimes to show people take time to learn.
$\Rightarrow$ Costs of tax complexity.
Many, especially low education, low skill, make wrong regime choice and leave a lot of money on the table. They also learn more slowly.
$\Rightarrow$ "Regressive costs of tax complexity."

## Related Literature

## Outline

(1) Landscape of Self-Employment and Institutional Background
(2) Data and Descriptive Statistics
(3) Bunching in the Simpler Regimes: Graphical Evidence
(4) Estimating the Value of Tax Simplicity
(5) Tax Complexity and Learning
(6) Misreporting or Real Responses?

## Outline

(1) Landscape of Self-Employment and Institutional Background (2) Data and Descriptive Statistics (3) Bunching in the Simpler Regimes: Graphical Evidence (4) Estimating the Value of Tax Simplicity (5) Tax Complexity and Learning

## Activity Types:

Different Activities Have Different Policy Parameters
(1) Industrial and Commercial Services (IEC Services): construction work, plumbery, carpenters, auto repair, dry cleaning...
(2) Industrial and Commercial Retail (IEIC Retail): bakeries, butcheries, cheese shops, restaurants, ..
(3) Non Commercial (NC:) professional activities, consulting, coaching, translation services, sales agents services, expert services, empty property subleasing, liberal professions (doctors, lawyers in private practices, notaries..).

# Tax Simplicity by Self-Employed Regime 

Increasing tax simplicity

## Summary of the Self-Employed Regimes

| Population (in mill.) | 34.7 | 22.5 | 12.6 |

Non-Commercial: more women, more children, less retirees, and much more educated.

## Service vs. Non Commercial Activities (Income)

|  | All | Industrial and <br> Commercial (Retail <br> and Service) | Non Commercial |
| :--- | ---: | ---: | ---: |

Non-Commercial are much richer (from self-employed income).

## Outline

(1) Landscape of Self-Employment and Institutional Background
(2) Data and Descriptive Statistics
(3) Bunching in the Simpler Regimes: Graphical Evidence (4) Estimating the Value of Tax Simplicity (5) Tax Complexity and Learning

## Modeling the Discontinuity at Eligibility Thresholds

- Eligibility thresholds create tax "notches" in both monetary incentives and in simplicity (unlike standard tax notches).
- Change in tax rates and tax base.
- Change in tax hassle costs $\Delta a$.
- Total liability expressed as a function of revenues $y$ :

$$
T(y)=t y+(\Delta a+\Delta t y) I\left(y>y^{*}\right)
$$

- Can write: $t=t\left(\tau^{y}, \tau_{m}^{s 5}, \mu\right), \Delta t=\Delta t\left(\tau^{y}, \tau_{m}^{s 5}, \tau_{r}^{s s}, \mu\right)$.
- These policy parameters differ across people (by activity type or tax bracket) and years.
- e.g., $\Delta t$ higher for higher tax bracket agents $\Rightarrow$ larger notch.

$$

## Agents with Additional Income Sources - Pensions

(a) With retirement (pension) income

$$
b=1.88(0.4)
$$

(b) Without pension income

$$
b=0.67(0.05)
$$

## Bunching by Education Level

## Outline

## (1) Landscape of Self-Employment and Institutional Background

(2) Data and Descriptive Statistics
(3) Bunching in the Simpler Regimes: Graphical Evidence
(4) Estimating the Value of Tax Simplicity
(5) Tax Complexity and Learning
(6) Misreporting or Real Responses?

## Structural Model

Recall that $B \approx f_{0}\left(y^{*}\right) \Delta y^{*}$
$\Rightarrow$ back out total revenue response $\Delta y^{*}$ from excess mass $B$.
An agent's tax liability can generically be written as:

$$
T(y)=t y+(\Delta a+\Delta t y) I\left(y>y^{*}\right)
$$

Can write: $t=t\left(c_{i}, \tau^{y}, \tau_{m}^{s s}, \mu\right), \Delta t=\Delta t\left(c_{i}, \tau^{y}, \tau^{s s}, \mu\right)$.
For each regime, person, activity, tax bracket: different parameters.

## Structural Model (II)

Utility:

$$
u_{i}(y)=y-T_{i}(y)-h\left(y, \theta_{i}\right)-a_{i}
$$

Parameterize disutility of earning revenues (iso-elastic) where $\theta$ is "ability type" and $\varepsilon$ is income elasticity.

$$
h(y, \theta)=\frac{\theta}{1+\frac{1}{\varepsilon}}\left(\frac{y}{\theta}\right)^{1+\frac{1}{\varepsilon}}
$$

## Structural Model: Graphical Illustration

Consumption $y-T(y)$

## Structural Model: Graphical Illustration

Consumption $y-T(y)$

## Structural Model: Graphical Illustration

Consumption $y-T(y)$

Individual L
indifference curve

Revenues $y$

## Structural Model (III)

Absent the notch, marginal agent $\theta^{*}+\Delta \theta^{*}$ in the simplified regime would have chosen revenue level $y^{*}+\Delta y^{*}$ characterized by tangency:

$$
y^{*}+\Delta y^{*}=\left(\theta^{*}+\Delta \theta^{*}\right)\left[\left(1-c_{m}\right)-\tau_{m}(1-\mu)\right]^{\varepsilon}
$$

With the threshold this agent locates exactly at notch $y^{*}$ and his utility is:

$$
u_{m}^{*}=y^{*}\left(1-c_{m}\right)-\tau_{m}(1-\mu) y^{*}-h\left(y^{*}, \theta^{*}+\Delta \theta^{*}\right)-a_{m}
$$

$y_{r}^{\prime}$ is the indifference point such that agent indifferent between being right at threshold $y^{*}$ or at $y_{r}^{\prime}$ in standard regime, with utility:

$$
u_{r}^{\prime}=y_{r}^{\prime}\left(1-c_{r}\right)\left(1-\tau_{r}\right)-h\left(y_{r}^{\prime}, \theta^{*}+\Delta \theta^{*}\right)-a_{r}
$$

Indifference point is characterized by tangency condition in standard regime:

$$
y_{r}^{\prime}=\left(\theta^{*}+\Delta \theta^{*}\right)\left[\left(1-c_{r}\right)\left(1-\tau_{r}\right)\right]^{\varepsilon}
$$

## Structural Model (IV)

Indifference condition: $u_{r}^{l}=u_{m}^{*}$.
Yields equation in $\varepsilon$ and $\Delta a$, given policy parameters $t, \Delta t$ and revenue response $\Delta y^{*}$ measured in the data and policy parameters $\left(y^{*}, t, \Delta t\right)$.

$$
\begin{gathered}
\frac{1}{1+\Delta y^{*} / y^{*}}\left[1+\frac{\Delta a / y^{*}}{1-t}\right]-\frac{1}{1+1 / \varepsilon}\left[\frac{1}{1+\Delta y^{*} / y^{*}}\right]^{1+1 / \varepsilon} \\
-\frac{1}{1+\varepsilon}\left[1-\frac{\Delta t}{1-t}\right]^{1+\varepsilon}=0
\end{gathered}
$$

Consider three cases:
Case 1: If people do not value tax simplicity (standard case, upper bound on $\varepsilon$ ). Also: reduced form approximation.

Case 2: People do not understand/pay attention to monetary incentives (upper bound on a).

Case 3: Full estimation using method of moments.

## Case 1: Elasticity Estimates if no Preference for Tax Simplicity Simplified Regime

| Cost |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Activity Type | Tax <br> (\% of rebate) | Earnings <br> bracket | ATR <br> Response $\Delta y^{*}$ | Reduced-Form <br> Jump $\Delta t^{*}$ | Structural <br> Elasticity $e_{R}$ | Elasticity e |

Revenue responses range from $2.4 \%$ to $8.1 \%$ of threshold revenues. Notches are distortionary even with small structural elasticities. Optimization frictions would inflate these estimates by $1 /(1-f)$.

# Case 1: Elasticity Estimates if no Preference for Tax Simplicity Super Simplified Regime 

|  | Cost | Tax | Earnings | ATR | Reduced-Form | Structural |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Activity Type | (\% of rebate) | bracket | Response $\Delta y^{*}$ | Jump $\Delta t^{*}$ | Elasticity $e_{R}$ | Elasticity e |

| Panel B - Super Simplified |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| IEIC Services | 0.3 | 1 | 3,460 | 0.60 | 0.56*** (0.099) | 0.25**** (0.039) |
|  |  | 2-3 | 3,660 | 2.30 | 0.11*** (0.034) | 0.05*** (0.014) |
|  |  | All |  |  | $0.26{ }^{* * * *}(0.056)$ | 0.12*** (0.022) |
| Non Commercial | 0.3 | 1 | 3,000 | 0.36 | 1.02** (0.487) | 0.45*** (0.194) |
|  |  | 2-3 | 3,700 | 2.63 | 0.12*** (0.015) | 0.06**** (0.006) |
|  |  | All |  |  | 0.17**** (0.042) | 0.08**** (0.018) |

Revenue responses range from $10.8 \%$ to $11.5 \%$ of threshold revenues.

## Case 2: Upper Bound on Tax Hassle Costs for the Simplified Regime

|  | IEC Services |  |  | Non Commercial |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Tax Bracket | Hassle Cost | Hours |  | Hassle Cost | Hours |
| 1 | 240 | 24 |  | 420 | 42 |
| 2 | 390 | 39 |  | 536 | 54 |
| $3+$ | 600 | 60 |  | 600 | 60 |

## Case 3: Structural Estimation Method

Under full generality, there would be a triplet ( $\varepsilon_{n k i}, a_{n k i}, c_{n k i}$ ) for each regime $n$, activity $k$, and tax bracket $i$.

Assumptions (relaxable): 1) Everything is allowed to differ by regime.
2) Income elasticities are same across activities, but differ by tax bracket.
3) Operating and hassle costs are the same across tax brackets, but differ by activity.

Vector of parameters:

Loss function:

$$
L\left(x_{n}\right)=\sum_{m=1}^{M} \frac{1}{M}\left(\hat{\Delta} y_{n k i t}^{*}-\Delta y_{n k i t}^{*}\right)^{2}
$$

where $t$ is groups of years during which no change in policy parameters.

## Outline

## (1) Landscape of Self-Employment and Institutional Background

## (2) Data and Descriptive Statistics

(3) Bunching in the Simpler Regimes: Graphical Evidence
(4) Estimating the Value of Tax Simplicity
(5) Tax Complexity and Learning

## Costly Learning

People value simplicity in a given regime.

Let us now zoom out and look at the system as a whole and more precisely at what happens when policies change over time.

First, let's look at the introduction of the new super simplified regime after 2008 and at the sluggish adjustments to it.

Second, let's show more generally that people take time to learn.

## Slow Adjustment to the New Regime Introduction (2008 Reform)

(a) Number of self-employed agents

(b) Average income per self-employed agents

## Fast Adjustment to Expansion of Existing Regime (1999 Reform)

(a) Number of self-employed agents

(b) Average income per self-employed agents

Bunching After the Introduction of the Super Simplified Regime

Financial Loss from Not Choosing the Super Simplified Regime (as a \% of revenues)

## Slow Learning: Bunching at the "Old" Threshold

(a) 2011

(b) 2012

## Outline

## (1) Landscape of Self-Employment and Institutional Background

## (2) Data and Descriptive Statistics

(3) Bunching in the Simpler Regimes: Graphical Evidence
(4) Estimating the Value of Tax Simplicity
(5) Tax Complexity and Learning
(6) Misreporting or Real Responses?

## Bunching at Round Numbers in Different Regimes

(a) Standard Regime

(b) Simplified Regime

(c) Super Simplified Regime

## Income Shifting Within the Household: More Bunching in Two-Earners Households

(a) Households with one self-employed agent

$$
b=0.78(0.06)
$$

(b) Households with two self-employed agents

$$
b=3.16(0.67)
$$

$\Rightarrow$ Could be selection (individuals who like to evade taxes live together), or simply more information in two earner households.

## Income Shifting Within the Household: Lower earner's revenues

Two bigger jumps: i) right before threshold, ii) in the tolerance region.

Income Shifting Within the Household: Bunching at Twice the Threshold

Learning to "Shift Income" Within the Household Early Period 1999-2001

Learning to "Shift Income" Within the Household Later Period 2002-2008

Learning to "Shift Income" Within the Household Sum of Revenues at Twice the Threshold

## Conclusion

Study effects of tax incentives and tax simplicity on self-employed.
New French tax returns 1994-2012, combined with survey data.
Large value for tax simplicity (160 to 650 euros).
Tax complexity is costly:
Agents learn slowly over time about policies and make dominated regime choices.

Tax complexity can be regressive:
Low education, low skill, low income agents make wrong choices and learn slower.

## APPENDIX

Bunching in the Simplified Regime, 1999-2008

## Modeling the Tax Discontinuities

| Standard regime: | $\tau_{r}=\tau^{y}+\tau_{r}^{s s}\left(1-\tau^{y}\right)$ |
| :--- | :---: |
| Simplified regime: | $\tau_{m}=\tau^{y}+\tau_{m}^{s s}$ |
| Super simplified regime: | $\tau_{f}$ |
| Standard regime: | $t_{r}=c_{r}+\left(\tau^{y}+\tau_{r}^{s s}\left(1-\tau^{y}\right)\right)\left(1-c_{r}\right)$ |
| Simplified regime: | $t_{m}=c_{m}+\left(\tau^{y}+\tau_{m}^{s s}\right)(1-\mu)$ |
| Super simplified regime: | $t_{f}=c_{f}+\tau_{f}$ |

## Sensitivity of Elasticity Estimates to Hassle Costs a, I\&IC Services
